Sources of Data for Each Element

Numbers following the element name refer to the references on the following pages.

Actinium: 193

Aluminum: 6,8,81,89,127,144,146,227,228,282

Americium: 92

Antimony: 164,167,194,386,406

Argon: 190,203,204,219,367,368,372,373,374,375,414,421

Arsenic: 163,168,197,244,280

Astatine: 188

Barium: 1,78,111,252,259,277,279

Berkelium: 53,339

Beryllium: 15,44,73,102,115,134,135,171,175,198,335

Bismuth: 1,357,358,359,360,361

Boron: 66,69,74,94,104,171,221,222

Bromine: 42,122,124,139,142,240,243,246,248,249,250,316

Cadmium: 44,285,296,353,399

Calcium: 16,25,70,150,270

Californium: 52,331

Carbon: 22,66,211

Cerium: 1,136,166,261,305

Cesium: 78,82,154,155,200,201,259,263,325

Chlorine: 11,28,30,31,85,233,238,239

Chromium: 1,379,380,412

Cobalt: 1,100,125,159,236,276,291

Copper: 199,273,290,295,324

Curium: 51,332

Dysprosium: 1

Einsteinium: 333

Erbium: 1,301

Europium: 1,312

Fluorine: 68,169,224,225,226

Francium: 408

Gadolinium: 1,46,137,151,152

Gallium: 2,19,62,132,140,141,143,195,281

Germanium: 5,119,293,340,341,342

Gold: 38,72,234,393,395

Hafnium: 1,369,404,410,425

Helium: 16,94,173,183,317

Holmium: 1

Hydrogen: 214

Indium: 1,132,348,349,350,351,352,353,435,436

Iodine: 20,21,58,84,124,153,161,176,184

Iridium: 1

Iron: 56,63,71,101,105,138,174,278,381,382

Krypton: 61,121,123,147,208,232,366,390,409,417,421

Lanthanum: 1,78,79,220,309

Lead: 54,64,106,256,274,297,283,329,330

Lithium: 3,15,17,18,37,44,112,284,321,335

Lutetium: 1,148,310,401

Magnesium: 4,7,49,83,103,128,129,177,217,269,315,335

Manganese: 1,126,385,405,433

Mercury (198): 43,50,69,145,229,242

Mercury (Natural): 34,45,90,117,133,189,235,304,327,328,343

Molybdenum: 1,383,420

Neodymium: 1

Neon: 56,58,69,118,150,230,364,365,371,388,389,400,402,413,430

Neptunium: 93

Nickel: 1,294,415,416,422

Niobium: 1,392,407,431

Nitrogen: 66,107,108,212,213,318

Osmium: 1

Oxygen: 23,24,36,66,69,209,210,215

Palladium: 1,287,424

Phosphorus: 179,180,182,336

Platinum: 1,288

Plutonium: 91

Polonium: 47,48

Potassium: 32,59,60,75,76,86,150,160,172,268,314,322

Praseodymium: 1,149,306,308,337,338

Promethium: 196,260

Protactinium: 96

Radium: 253,254

Radon: 251

Rhenium: 1

Rhodium: 1,396

Rubidium: 12,109,130,241,257,258,262,264

Ruthenium: 1,423

Samarium: 1

Scandium: 1,88,150,298,323

Selenium: 9,80,181,216,245,247,275

Silicon: 87,170,237,292,319,320

Silver: 13,99,255,286,289,363,387,398

Sodium: 178,205,206,207,268,299,334

Strontium: 1,109,110,218,231,265,279,313

Sulfur: 29,144,202,209,210,266

Tantalum: 1,411,426

Technetium: 35

Tellurium: 1,344,345,346,347

Terbium: 1,302

Thallium: 1,195,348,354,355,356

Thorium: 1,97,98,156,157,165,434

Thulium: 1,307

Tin: 187,191,399,423

Titanium: 1,378,427,428

Tungsten: 1

Uranium: 1,303

Vanadium: 1,394,397,432

Xenon: 33,116,118,120,232,384,391,429

Ytterbium: 1,40,192,311

Yttrium: 1,77,265,419

Zinc: 39,55,113,131,185,186,370,376,377

Zirconium: 1,362,403,418

NIST ATOMIC TRANSITION PROBABILITIES

J. R. Fuhr and W. L. Wiese

For the 2005 edition of this *Handbook*, we include new, more accurate data for Fe I and Fe II,¹ and Ba I and Ba II.² The new tables contain critically evaluated atomic transition probabilities for over 10500 selected lines of all elements for which reliable data are available on an absolute scale. The material is largely for neutral and singly ionized spectra, but also includes a number of prominent lines of more highly charged ions of important elements.

Many of the data are obtained from comprehensive compilations of the Data Center on Atomic Transition Probabilities at the National Institute of Standards and Technology. Specifically, data have been taken from three recent comprehensive critical compilations on C, N and O,³ on Sc through Mn⁴ and Fe through Ni,⁵ and special compilations on neutral and singly ionized iron and barium. Material from earlier compilations for the elements H through Ne⁶ and Na through Ca⁷ was supplemented by more recent material taken directly from the original literature. For the highly charged ions, some of the data were derived from studies of the systematic behavior of transition probabilities.⁸⁻¹⁰ Most of the original literature is cited in the above tables and in recent bibliographies;^{11,12} for lack of space, individual literature references are not cited here.

The wavelength range for the neutral species is normally the visible spectrum or shorter wavelengths; only the very prominent near infrared lines are included. For the higher ions, most of the strong lines are located in the far UV. The tabulation is limited to electric dipole — including intercombination — lines and comprises essentially the fairly strong transitions with estimated uncertainties in the 10% to 50% range. With the exception of hydrogen, helium, and the alkali metals, most transitions are between states with low principal quantum numbers.

The transition probability, A , is given in units of 10^8 s^{-1} and is listed to as many digits as is consistent with the indicated accuracy. The power of 10 is indicated by the E notation (i.e., E-02 means 10^{-2}). Generally, the estimated uncertainties of the A -values are ± 25 to 50% for two-digit numbers, ± 10 to 25% for three-digit numbers and $\pm 1\%$ or better for four- and five-digit numbers.

Each transition is identified by the wavelength λ in ångströms ($1 \text{ Å} = 10^{-10} \text{ m}$); and the statistical weights, g_i and g_k , of the lower (i) and upper (k) states [the product $g_i A$ (or $g_k f$) is needed for many applications]. Whenever the wavelengths of individual lines within a multiplet are extremely close, only an average wavelength for the multiplet as well as the multiplet A -value are given, and this is indicated by an asterisk (*) to the left of the wavelength. This also has been done when the transition probability for an entire multiplet has been taken from the literature and values for individual lines cannot be determined because of insufficient knowledge of the coupling of electrons. The wavelength data have been taken either from recent compilations or from the original literature cited in bibliographies published by the Atomic Energy Levels Data Center^{13,14} at the National Institute of Standards and Technology. Wavelength values are consistent with those given in the table “Line Spectra of the Elements,” which appears elsewhere in this *Handbook*.

In addition to the transition probability A , the atomic oscillator strength f and the line strength S are often used in the literature. The conversion factors between these quantities are (for electric-dipole transitions):

$$g_i f = 1.499 \cdot 10^{-8} \lambda^2 g_k A = 303.8 \lambda^{-1} S$$

where λ is in ångströms, A is in 10^8 s^{-1} , and S is in atomic units, which are

$$a_0^2 e^2 = 7.188 \cdot 10^{-59} \text{ m}^2 \text{ C}^2.$$

The table for hydrogen is presented first, followed by the tables for other elements in alphabetical sequence by element name (not symbol). Within each element, the tables are ordered by increasing ionization stage (e.g., Al I, Al II, etc.).

The transition probabilities for hydrogen and hydrogen-like ions are known precisely. Because of the hydrogen degeneracy, a “transition” is actually the sum of all fine-structure transitions between the principal quantum numbers; therefore, the hydrogen table gives weighted average A -values. For hydrogen-like ions of nuclear charge Z , the following scaling laws hold:

$$A_Z = Z^4 A_{\text{Hydrogen}}$$

$$f_Z = f_{\text{Hydrogen}}$$

$$S_Z = Z^{-2} S_{\text{Hydrogen}}$$

$$\lambda_Z = Z^{-2} \lambda_{\text{Hydrogen}}$$

For very highly charged hydrogen-like ions, starting at about $Z > 25$, relativistic corrections¹⁵ must be applied.

ELECTRON AFFINITIES

Thomas M. Miller

Electron affinity is defined as the energy difference between the lowest (ground) state of the neutral and the lowest state of the corresponding negative ion. The accuracy of electron affinity measurements has been greatly improved since the advent of laser photodetachment experiments with negative ions. Electron affinities can be determined with optical precision, though a detailed understanding of atomic and molecular states and splittings is required to specify the photodetachment threshold corresponding to the electron affinity.

Atomic and molecular electron affinities are discussed in two excellent articles reviewing photodetachment studies which appear in *Gas Phase Ion Chemistry*, Vol. 3, Bowers, M. T., Ed., Academic Press, Orlando, 1984: Chapter 21 by Drzaic, P. S., Marks, J., and Brauman, J. I., "Electron Photodetachment from Gas Phase Negative Ions," p. 167, and Chapter 22 by Mead, R. D., Stevens, A. E., and Lineberger, W. C., "Photodetachment in Negative Ion Beams," p. 213. Persons interested in photodetachment details should consult these articles and the critical reviews of Andersen, T., Haugen, H. K., and Hotop, H., *J. Phys. Chem. Ref. Data*, 28, 1511, 1999, Hotop, H. and Lineberger, W. C., *J. Phys. Chem. Ref. Data*, 14, 731, 1985, and Andersen, T., Haugen, H. K., and Hotop, H., *J. Phys. Chem. Ref. Data* 28, 1511, 1999. For simplicity in the tables below, any electron affinity which was discussed in the articles by Drzaic et al. or Hotop and Lineberger is referenced to these sources, where original references are given. The develop-

ment of cluster-ion photodetachment apparatuses has brought an explosion of electron affinity estimates for atomic and molecular clusters. The policy in this tabulation is to list the electron affinities for the atoms, diatoms, and triatoms, if adiabatic electron affinities have been determined, but to refer the reader to original sources for higher-order clusters. Additional data on molecular electron affinities may be found in Lias, S. G., Bartmess, J. E., Liebman, J. F., Holmes, J. L., Levin, R. D., and Mallard, W. G., *Gas Phase Ion and Neutral Thermochemistry*, *J. Phys. Chem. Ref. Data*, 17, (Supplement No. 1), 1988 and on the NIST WebBook at the Internet address <http://webbook.nist.gov/>.

For the present tabulation the 2002 CODATA value $e/hc = 8065.54445 \pm 0.00069 \text{ cm}^{-1} \text{ eV}^{-1}$ (<http://physics.nist.gov>) has been used to convert electron affinities from the units used in spectroscopic work, cm^{-1} , into eV for these tables. The 86 ppb uncertainty in e/hc is insignificant compared to uncertainties in the electron affinity measurements.

Abbreviations used in the tables: calc = calculated value; PT = photodetachment threshold using a lamp as a light source; LPT = laser photodetachment threshold; LPES = laser photoelectron spectroscopy; DA = dissociative attachment; attach = electron attachment/detachment equilibrium; e-scat = electron scattering; kinetic = dissociation kinetics; Knud=Knudsen cell; CT = charge transfer; CD = collisional detachment; and ZEKE = zero electron kinetic energy spectroscopy.

- Ellison, G. B., and Oakes, J. M., *J. Am. Chem. Soc.*, 106, 7734, 1984. EA(allyl) and EA(allyl-d₃) are 0.119 and 0.083 eV too low, respectively,

- in this work, according to Ref. 138. Therefore, EA(allyl-d₁) is likely too low by a similar amount.

ATOMIC AND MOLECULAR POLARIZABILITIES

Thomas M. Miller

The *polarizability* of an atom or molecule describes the response of the electron cloud to an external field. The atomic or molecular energy shift ΔW due to an external electric field E is proportional to E^2 for external fields which are weak compared to the internal electric fields between the nucleus and electron cloud. The *electric dipole polarizability* α is the constant of proportionality defined by $\Delta W = -\alpha E^2/2$. The induced electric dipole moment is αE . *Hyperpolarizabilities*, coefficients of higher powers of E , are less often required. Technically, the polarizability is a tensor quantity but for spherically symmetric charge distributions reduces to a single number. In any case, an *average polarizability* is usually adequate in calculations. Frequency-dependent or *dynamic polarizabilities* are needed for electric fields which vary in time, except for frequencies which are much lower than electron orbital frequencies, where *static polarizabilities* suffice.

Polarizabilities for atoms and molecules in excited states are found to be larger than for ground states and may be positive or negative. Molecular polarizabilities are very slightly temperature dependent since the size of the molecule depends on its rovibrational state. Only in the case of dihydrogen has this effect been studied enough to warrant consideration in Table 3.

Polarizabilities are normally expressed in cgs units of cm^3 . Ground state polarizabilities are in the range of $10^{-24} \text{ cm}^3 = 1 \text{ \AA}^3$ and hence are often given in \AA^3 units. Theorists tend to use atomic units of a_0^3 where a_0 is the Bohr radius. The conversion is $\alpha(\text{cm}^3) = 0.148184 \times 10^{-24} \times \alpha(a_0^3)$. Polarizabilities are only recently encountered in SI units, $\text{C m}^2/\text{V} = \text{J}/(\text{V/m})^2$. The conversion from cgs units to SI units is $\alpha(\text{C m}^2/\text{V}) = 4\pi\epsilon_0 \times 10^{-6} \alpha(\text{cm}^3)$, where ϵ_0 is

the permittivity of free space in SI units and the factor 10^{-6} simply converts cm^3 into m^3 . Thus, $\alpha(\text{C m}^2/\text{V}) = 1.11265 \times 10^{-16} \times \alpha(\text{cm}^3)$. Persons measuring excited state polarizabilities by optical methods tend to use units of $\text{MHz}/(\text{V/cm})^2$, where the energy shift, ΔW , is expressed in frequency units with a factor of h understood. The polarizability is $-2 \Delta W/E^2$. The conversion into cgs units is $\alpha(\text{cm}^3) = 5.95531 \times 10^{-16} \times \alpha[\text{MHz}/(\text{V/cm})^2]$.

The polarizability appears in many formulas for low-energy processes involving the valence electrons of atoms or molecules. These formulas are given below in cgs units: the polarizability α is in cm^3 ; masses m or μ are in grams; energies are in ergs; and electric charges are in esu, where $e = 4.8032 \times 10^{-10}$ esu. The symbol $\alpha(\nu)$ denotes a frequency (ν) dependent polarizability, where $\alpha(\nu)$ reduces to the static polarizability α for $\nu = 0$. For further information, see Bonin, K. D., and Kresin, V. V., *Electric Dipole Polarizabilities of Atoms, Molecules, and Clusters*, World Scientific, Singapore, 1997; Bonin, K. D., and Kadar-Kallen, *Int. J. Mod. Phys. B*, 24, 3313, 1994; and Miller, T. M., and Bederson, B., *Advances in Atomic and Molecular Physics*, 13, 1, 1977, and Gould, H., and Miller, T. M., *Advances in Atomic, Molecular, and Optical Physics*, 51, 243, 2005. Details on polarizability-related interactions, especially in regard to hyperpolarizabilities and nonlinear optical phenomena, are given by Bogaard, M. P., and Orr, B. J., in *Physical Chemistry, Series Two, Vol. 2, Molecular Structure and Properties*, Buckingham, A. D., Ed., Butterworths, London, 1975, pp. 149-194. A tabulation of tensor and hyperpolarizabilities is included. The gas number density, n , in Table 1 is usually taken to be that of 1 atm at 0°C in reporting experimental data.

TABLE 1. Formulas Involving Polarizability

Description	Formula	Remarks
Lorentz-Lorenz relation	$\alpha(\nu) = \frac{3}{4\pi n} \left[\frac{\eta^2(\nu) - 1}{\eta^2(\nu) + 2} \right]$	For a gas of atoms or nonpolar molecules; the index of refraction is $\eta(\nu)$
Refraction by polar molecules	$\alpha(\nu) + \frac{d^2}{3kT} = \frac{3}{4\pi n} \left[\frac{\eta^2(\nu) - 1}{\eta^2(\nu) + 2} \right]$	The dipole moment is d , in esu cm ($= 10^{-18}$ D)
Dielectric constant (dimensionless)	$\kappa(\nu) = 1 + 4\pi n \alpha(\nu)$	From the Lorentz-Lorenz relation for the usual case of $\kappa(\nu) \approx 1$
Index of refraction (dimensionless)	$\eta(\nu) = 1 + 2\pi n \alpha(\nu)$	From $\eta^2(\nu) = \kappa(\nu)$
Diamagnetic susceptibility	$\chi_m = e^2 (a_0 N \alpha)^{1/2} / 4m_e c^2$	From the approximation that the static polarizability is given by the variational formula $\alpha = (4/9a_0) \Sigma (N r_i^2)^2$; N is the number of electrons, m_e is the electron mass; a crude approximation is $\chi_m = (E_i/4m_e c^2) \alpha$, where E_i is the ionization energy
Long-range electron- or ion-molecule interaction energy	$V(r) = -e^2 \alpha / 2r^4$	The target molecule polarizability is α
Ion mobility in a gas	$\kappa = -13.87 / (\alpha \mu)^{1/2} \text{ cm}^2 / \text{V} \cdot \text{s}$	This one formula is not in cgs units. Enter α in \AA^3 or 10^{-24} cm^3 units and the reduced mass μ of the ion-molecule pair in amu. Classical limit; pure polarization potential
Langevin capture cross section	$\sigma(v_o) = (2\pi e / v_o) (\alpha / \mu)^{1/2}$	The relative velocity of approach for an ion-molecule pair is v_o ; the target molecular polarizability is α and the reduced mass of the ion-molecule pair is μ
Langevin reaction rate coefficient	$k = 2\pi e (\alpha / \mu)^{1/2}$	Collisional rate coefficient for an ion-molecule reaction
Rate coefficient for polar molecules	$k_d = 2\pi e \left[(\alpha / \mu)^{1/2} + cd(2 / \mu \pi kT)^{1/2} \right]$	The dipole moment of the neutral is d in esu cm; the number c is a "locking factor" that depends on α and d , and is between 0 and 1

Description	Formula	Remarks
Modified effective range cross section for electron-neutral scattering	$\sigma(k) = 4\pi A^2$ $+ 32\pi^4 \frac{e^2 \alpha A k}{3\hbar^2}$ $+ \dots$	Here, k is the electron momentum divided by $\hbar/2\pi$, where \hbar is Planck's constant; A is called the "scattering length"; the reduced mass is μ
van der Waals constant between two systems A, B	$C_6 = \frac{3}{2} \left[\frac{\alpha^A \alpha^B E^A E^B}{E^A + E^B} \right]$	For the interaction potential term $V_6(r) = -C_6/r^6$; $E^{A,B}$ represents average dipole transition energies and $\alpha^{A,B}$ the respective polarizabilities of A, B
Dipole-quadrupole constant between two systems A, B	$C_8 = \frac{15}{4} \left[\frac{\alpha^A \alpha_q^B E^A E_q^B}{E^A + E_q^B} \right]$ $+ \frac{15}{4} \left[\frac{\alpha_q^A \alpha^B E_q^A E^B}{E_q^A + E^B} \right]$	For the interaction potential term $V_8(r) = -C_8/r^8$; $E_q^{A,B}$ represents average quadrupole transition energies and $\alpha_q^{A,B}$ are the respective quadrupole polarizabilities of A, B
van der Waals constant between an atom and a surface	$C_3 = \frac{\alpha g E^A E^S}{8(E^A + E^S)}$	For an interaction potential $V_3(r) = -C_3/r^3$; $E^{A,S}$ are characteristic energies of the atom and surface; $g = 1$ for a free-electron metal and $g = (\epsilon_\infty - 1)/(\epsilon_\infty + 1)$ for an ionic crystal
Relationship between $\alpha(v)$ and oscillator strengths	$\alpha(v) = \frac{e^2 \hbar^2}{4\pi^2 m_e} \sum \frac{f_k}{E_k^2 - (h\nu)^2}$	Here, f_k is the oscillator strength from the ground state to an excited state k , with excitation energy E_k . This formula is often used to estimate static polarizabilities ($v = 0$)
Dynamic polarizability	$\alpha(v) = \frac{\alpha E_r^2}{E_r^2 - (h\nu)^2}$	Approximate variation of the frequency-dependent polarizability $\alpha(v)$ from $v = 0$ up to the first dipole-allowed electronic transition, of energy E_r ; the static dipole polarizability is $\alpha(0)$; infrared contributions ignored
Rayleigh scattering cross section	$\alpha(v) = \frac{8\pi}{9c^4} (2\pi\nu)^4$ $\times [3\alpha^2(v) + 2\gamma^2(v)/3]$	The photon frequency is ν ; the polarizability anisotropy (the difference between polarizabilities parallel and perpendicular to the molecular axis) is $\gamma(v)$
Verdet constant	$V(v) = \frac{\nu n}{2m_e c^2} \left[\frac{d\alpha(v)}{d\nu} \right]$	Defined from $\theta = V(v)B$, where θ is the angle of rotation of linearly polarized light through a medium of number density n , per unit length, for a longitudinal magnetic field strength B (Faraday effect)

						79	31

Note: All polarizabilities in the tables are experimental values except those values marked by an asterisk (*), which indicates a calculated result. The experimental polarizabilities are mostly determined by measurements of a dielectric constant or refractive index which are quite accurate (0.5% or better). However, one should treat many of the results with several percent of caution because of the age of the data and because some of the results refer to optical frequencies rather than static. Comments given with the references are intended to allow one to judge the degree of caution required. Interested persons should consult these references. In many cases, the reference given is to a theoretical paper in which the experimental results are quoted. These papers, noted in the References, contain valuable information on polarizability calculations and experimental data which often includes the tensor components of the polarizability.

An empirical additive formula for molecular polarizabilities at 589 nm frequency has been given in Bosque, R., and Sales, J., *J. Chem. Inf. Comput. Sci.* 42, 1154, 2002: $\alpha = 0.32 + 1.51\#C + 0.17\#H + 0.57\#O + 1.05\#N + 2.99\#S + 2.48\#P + 2.16\#Cl + 3.29\#Br + 5.45\#I$, where "#C" denotes the number of carbon atoms in the molecule, etc.

- McCullough, E. A., Jr., *J. Chem. Phys.*, 63, 5050, 1975. This calculation is for the parallel component, not the average polarizability.
- Maryott, A. A., and Buckley, F., *U. S. National Bureau of Standards Circular No. 537*, 1953. A tabulation of dipole moments, dielectric constants, and molar refractions measured between 1910 and 1952, and used here to determine polarizabilities if no more recent result exists. The polarizability is $3/(4\pi N_A)$ times the molar polarization or molar refraction, where N_A is Avogadro's number. The value $3/(4\pi N_A) = 0.3964308 \times 10^{-24} \text{ cm}^3$ was used for this conversion. A dagger (†) following the reference number in the tables indicates that the polarizability was derived from the molar refraction and hence may not include some low-frequency contributions to the static polarizability; these "static" polarizabilities are therefore low by 1 to 30%.

32. Ritchie, G.L.D., and Watson, J.N., *J. Phys. Chem. A* 108, 4515, 2004. These measurements are at 632.8 nm frequency, and are stated accurate to 0.4%.
33. Ritchie, G.L.D., and Blanch, E.W., *J. Phys. Chem. A* 107, 2093, 2003. These measurements are at 632.8 nm frequency, and are stated accurate to better than 1%.

IONIZATION ENERGIES OF ATOMS AND ATOMIC IONS

The ionization energies (often called ionization potentials) of neutral and partially ionized atoms are listed in this table. Data were obtained from the compilations cited below, supplemented by results from the recent research literature. Values for the first and second ionization energies come from Reference 6. All values are given in electron volts (eV).

Following the traditional spectroscopic notation, columns are headed I, II, III, etc. up to XXX, where I indicates the neutral atom, II the singly ionized atom, III the doubly ionized atom, etc. The first section of the table includes spectra I to VIII of all the elements through rutherfordium; subsequent sections cover higher spectra (ionization stages) for those elements for which data are available.

IONIZATION ENERGIES OF GAS-PHASE MOLECULES

Sharon G. Lias

This table presents values for the first ionization energies (IP) of approximately 1000 molecules and atoms. Substances are listed by molecular formula in the modified Hill order (see Preface). Values enclosed in parentheses are considered not to be well established. Data appearing in the 1988 reference, were updated in 1996 for inclusion in the database of ionization energies available at the Internet site of the Standard Reference Data program of the National Institute of Standards and Technology (<http://webbook.nist.gov>). The list appearing here includes these updates.

The list also includes values for enthalpies of formation of the ions at 298 K, $\Delta_f H_{\text{ion}}$, given according to the ion convention used by

mass spectrometrists; to convert these values to the electron convention used by thermodynamicists, add 6 kJ/mol. Details on the calculation of $\Delta_f H_{\text{ion}}$, as well as data for a much larger number of molecules, may be found in the reference and on the Internet site.

X-RAY ATOMIC ENERGY LEVELS

The energy levels in this tables are the values recommended by Bearden and Burr on the basis of a thorough review of the literature on x-ray wavelengths and related data. All values are in electron volts (eV). Values in parentheses are interpolated, and an asterisk * indicates a level which is not resolved from the level above it. See Reference 1 for uncertainties in the levels and a complete description of how the recommended values were obtained.

ELECTRON BINDING ENERGIES OF THE ELEMENTS

Gwyn P. Williams

This table gives the binding energies in electron volts (eV) for selected electronic levels of the elements. For metallic elements the binding energy is referred to the Fermi level; for semiconductors, to the valence band maximum; and for gases and insulators, to the vacuum level. The atomic number is listed after the element name.

PHOTON ATTENUATION COEFFICIENTS

Martin J. Berger and John H. Hubbell

This table gives mass attenuation coefficients for photons for all elements at energies between 1 keV (soft x-rays) and 1 GeV (hard gamma rays). The mass attenuation coefficient μ describes the attenuation of radiation as it passes through matter by the relation

$$I(x)/I_0 = e^{-\mu\rho x}$$

where I_0 is the initial intensity, $I(x)$ the intensity after path length x , and ρ is the mass density of the element in question. To a high approximation the mass attenuation coefficient is additive for the elements present, independent of the way in which they are bound in chemical compounds.

The power of ten is indicated beside each number in the table; i.e., 7.41 + 03 means 7.41×10^3 . A vertical line between two columns indicates that an absorption edge lies between those energy values. The various edges are labeled at the bottom of the table.

The attenuation coefficients were calculated with the computer program XCOM (Reference 1), which uses a cross-section database compiled at the Photon and Charged Particle Data Center at the National Institute of Standards and Technology. Their accuracy has been confirmed at all energies by extensive comparisons with experimental attenuation coefficients. Such comparisons for X-ray energies up to 100 keV can be found in Reference 2.

CLASSIFICATION OF ELECTROMAGNETIC RADIATION

Hans Dolezalek

Basic Conversions:

$$c = \lambda \nu = \nu/k$$

$$\nu = c/\lambda = ck$$

$$\lambda = c/\nu = 1/k$$

$$k = \nu/c = 1/\lambda$$

$$c = \text{speed of light} = 2.99792458 \times 10^8 \text{ m/s}$$

Frequency (ν)	Wavelength (λ)	Wave number (k)	Names of bands	Approximate photon energies
3×10^0 — 3×10^1 Hz 3 — 30 Hz	10^8 — 10^7 m 100 — 10 Mm	10^{-8} — 10^{-7} m^{-1} 10 — 100 Gm^{-1}	ELF-(ELF 1), ITU band no. 1	
3×10^1 — 3×10^2 Hz 30 — 300 Hz	10^7 — 10^6 m 10 — 1 Mm	10^{-7} — 10^{-6} m^{-1} 100 Gm^{-1} — 1 Mm^{-1}	SLF-(ELF 2), ITU band no. 2, megameter waves	
3×10^2 — 3×10^3 Hz 300 Hz — 3 kHz	10^6 — 10^5 m 1 Mm — 100 km	10^{-6} — 10^{-5} m^{-1} 1 — 10 Mm^{-1}	ULF-(ELF 3), ITU band no. 3	
3×10^3 — 3×10^4 Hz 3 — 30 kHz	10^5 — 10^4 m 100 — 10 km	10^{-5} — 10^{-4} m^{-1} 10 — 100 Mm^{-1}	VLF, ITU band no. 4, myriameter waves	
3×10^4 — 3×10^5 Hz 30 — 300 kHz	10^4 — 10^3 m 10 — 1 km	10^{-4} — 10^{-3} m^{-1} 100 Mm^{-1} — 1 km^{-1}	LF, ITU band no. 5, kilometer waves	
3×10^5 — 3×10^6 Hz 300 kHz — 3 MHz	10^3 — 10^2 m 1 km — 100 m	10^{-3} — 10^{-2} m^{-1} 1 — 10 km^{-1}	MF, ITU band no. 6, hectometer waves	
3×10^6 — 3×10^7 Hz 3 — 30 MHz	10^2 — 10^1 m 100 — 10 m	10^{-2} — 10^{-1} m^{-1} 10 — 100 km^{-1}	HF, ITU band no. 7, decameter waves	
3×10^7 — 3×10^8 Hz 30 — 300 MHz	10^1 — 10^0 m 10 — 1 m	10^{-1} — 10^0 m^{-1} 100 km^{-1} — 1 mm^{-1}	VHF, ITU band no. 8, meter waves	
3×10^8 — 3×10^9 Hz 300 MHz — 3 GHz	10^0 — 10^{-1} 1 m — 100 mm	10^0 — 10^1 m^{-1} 1 — 10 m^{-1}	UHF, ITU band no. 9, decimeter waves ^a	
3×10^9 — 3×10^{10} Hz 3 — 30 GHz	10^{-1} — 10^{-2} 100 — 10 mm	10^1 — 10^2 m^{-1} 10 — 100 m^{-1}	SHF, ITU band no. 10, centimeter waves ^a	
3×10^{10} — 3×10^{11} Hz 30 — 300 GHz	10^{-2} — 10^{-3} m 10 — 1 mm	10^2 — 10^3 m^{-1} 100 m^{-1} — 1 mm^{-1} (1 — 10 cm^{-1})	EHF, ITU band no. 11, millimeter waves	
3×10^{11} — 3×10^{12} Hz 300 GHz — 3 THz	10^{-3} — 10^{-4} 1 mm — 100 μm	10^3 — 10^4 m^{-1} (1 — 10 mm^{-1}) (10 — 100 cm^{-1})	Part of micrometer waves, includes part of far or thermal infrared; ITU band no. 12	
3×10^{12} — 3×10^{13} Hz 3 — 30 THz	10^{-4} — 10^{-5} 100 — 10 μm	10^4 — 10^5 m^{-1} 10 — 100 mm^{-1} (100 — 1000 cm^{-1})	Part of micrometer waves includes part of far (thermal) infrared	
3×10^{13} — 3×10^{14} Hz 30 — 300 THz	10^{-5} — 10^{-6} m 10 — 1 μm (100,000 — 10,000 Å)	10^5 — 10^6 m^{-1} 100 mm^{-1} — $1 \mu\text{m}^{-1}$	Part of μm waves, part of infrared	$(1.6 — 16) \times 10^{-20}$ joule {0.1 — 1 eV}
3×10^{14} — 3×10^{15} Hz 300 THz — 3 PHz	10^{-6} — 10^{-7} m 1 μm — 100 m (10,000 — 1000 Å)	10^6 — 10^7 m^{-1} 1 — 10 μm^{-1}	Near infrared, visible, near ultraviolet	$(1.6 — 16) \times 10^{-19}$ joule {1 — 10 eV}
3×10^{15} — 3×10^{16} Hz 3 — 30 PHz	10^{-7} — 10^{-8} m 100 — 10 nm (1000 — 100 Å)	10^7 — 10^8 m^{-1} 10 — 100 μm^{-1}	Part of vacuum ultraviolet	$(1.6 — 16) \times 10^{-18}$ joule {10 — 100 eV}
3×10^{16} — 3×10^{17} Hz 30 — 300 PHz	10^{-8} — 10^{-9} m 10 — 1 nm (100 — 10 Å)	10^8 — 10^9 m^{-1} 100 μm^{-1} — 1 nm^{-1}	Part of soft X-rays	$(1.6 — 16) \times 10^{-17}$ joule {100 — 1000 eV}
3×10^{17} — 3×10^{18} Hz 300 PHz — 3 Eh	10^{-9} — 10^{-10} m 1 nm — 100 pm (10 — 1 Å)	10^9 — 10^{10} m^{-1} 1 — 10 nm^{-1}	Part of soft X-rays	$(1.6 — 16) \times 10^{-16}$ joule {1 — 10 keV}
3×10^{18} — 3×10^{19} Hz 3 — 30 Eh	10^{-10} — 10^{-11} m 100 — 10 pm (1 — 0.1 Å)	10^{10} — 10^{11} m^{-1} 10 — 100 nm^{-1}	Hard X-rays and part of soft γ -rays	$(1.6 — 16) \times 10^{-15}$ joule {10 — 100 keV}
3×10^{19} — 3×10^{20} Hz 30 — 300 Eh	10^{-11} — 10^{-12} m 10 — 1 pm (0.1 — 0.01 Å)	10^{11} — 10^{12} m^{-1} 100 nm^{-1} — 1 pm^{-1}	Part of soft and part of hard γ -rays (limit at 510 keV)	$(1.6 — 16) \times 10^{-14}$ joule {100 keV — 1 MeV}
3×10^{20} — 3×10^{21} Hz 300 — 3000 EH	10^{-12} — 10^{-13} m 1 pm — 100 fm (0.01 — 0.001 Å)	10^{12} — 10^{13} m^{-1} 1 — 10 pm^{-1}	Part of hard γ -rays and part of “cosmic” γ -rays	$(1.6 — 16) \times 10^{-13}$ joule {1 — 10 MeV}
3×10^{21} — 3×10^{22} Hz 3000 — 30,000 EH	10^{-13} — 10^{-14} m 100 — 10 fm (0.001 — 0.0001 Å)	10^{13} — 10^{14} m^{-1} 10 — 100 pm^{-1}	γ -rays produced by cosmic rays	$(1.6 — 16) \times 10^{-12}$ joule {10 — 100 MeV}

Note: Abbreviations used in this table: Å—ångstrom ($1 \text{ Å} = 10^{-10} \text{ m}$); EHz—exahertz (10^{18} hertz); EHF—extremely high frequency; ELF—extremely low frequency; eV—electron volt ($1 \text{ eV} = 1.60218 \times 10^{-19} \text{ joule}$); fm—femtometer (10^{-15} m); GHz—gigahertz (10^9 hertz); Gm—gigameter (10^9 m); HF—high frequency; Hz—hertz (s^{-1}); ITU—International Telecommunications Union; keV—kiloelectron volt (10^3 eV); km—kilometer (10^3 m); LF—low frequency; m—meter; MeV—megaelectron volt (10^6 eV); MF—medium frequency; MHz—megahertz (10^6 hertz); Mm—megameter (10^6 meter); mm—millimeter (10^{-3} meter); μm —micrometer (10^{-6} meter); nm—nanometer (10^{-9} meter); PHz—petahertz (10^{15} hertz); pm—picometer (10^{-12} meter); SHF—super high frequency; SLF—super low frequency; THz—terahertz; UHF—ultra high frequency; ULF—ultra low frequency; VHF—very high frequency; VLF—very low frequency.

^a Also called “microwaves”; not to be confused with “micrometer waves”.

LETTER DESIGNATIONS OF MICROWAVE BANDS

Frequency (GHz)	Wavelength (cm)	Wavenumber (cm^{-1})	Band
1—2	30—15	0.033—0.067	L-Band
1—4	15—7.5	0.067—0.133	S-Band
4—8	7.5—3.7	0.133—0.267	C-Band
8—12	3.7—2.5	0.267—0.4	X-Band
12—18	2.5—1.7	0.4—0.6	Ku-Band
18—27	1.7—1.1	0.6—0.9	K-Band
27—40	1.1—0.75	0.9—1.33	Ka-Band

BLACK BODY RADIATION

The total power radiated from an ideal black body and the wavelength corresponding to maximum power are given here as a function of absolute temperature. Constants used in the calculation are taken from the table “Fundamental Physical Constants” in

Section 1. The radiated power in a band $\Delta\lambda$ at λ_{\max} may be calculated from:

$$P_{\max} = 0.657548 (\Delta\lambda/\lambda_{\max}) P_{\text{tot}}$$

T/K	P_{tot}	$\lambda_{\max}/\mu\text{m}$	T/K	P_{tot}	$\lambda_{\max}/\mu\text{m}$	T/K	P_{tot}	$\lambda_{\max}/\mu\text{m}$

The curves below show, for various temperatures, the fraction of radiant power as a function of wavelength. The function plotted is $P_{\lambda}/\Delta\lambda P_{\text{tot}}$, where P_{λ} is the power at wavelength λ in a small interval $\Delta\lambda$ (in μm), and P_{tot} is the total power.

CHARACTERISTICS OF INFRARED DETECTORS

This graph summarizes the wavelength response of some semiconductors used as detectors for infrared radiation. The quantity $D^*(\lambda)$ is the signal to noise ratio for an incident radiant power density of 1 W/cm^2 and a bandwidth of 1 Hz (60° field of view). The Ge, InAs, and InSb detectors are photovoltaics, while the HgCdTe series are photoconductive devices. The cutoff wavelength of the latter can be varied by adjusting the relative amounts of Hg, Cd,

and Te (three examples are shown at 77 K). The graph also shows the theoretical background limited sensitivity for ideal detectors which introduce no intrinsic noise.

REFRACTIVE INDEX AND TRANSMITTANCE OF REPRESENTATIVE GLASSES

Typical values of the index of refraction and internal transmittance (fraction of light transmitted through a one centimeter thickness) are tabulated here for selected types of glasses, as well as for synthetic fused (vitreous) silica. Nominal compositions are given in the first part of the table. The second part gives the index of refraction, relative to air, and the internal transmittance for representative samples of each glass at wavelengths in the infrared, visible, and near-ultraviolet regions. It should be emphasized that wide variation of these parameters may be found among subtypes of each glass. More detailed data may be found in Reference 3.

Assuming that the Lambert-Beer Law is followed, the transmittance of a glass plate of thickness d (in centimeters) can be obtained by raising the transmittance value in the table to the power d .

INDEX OF REFRACTION OF WATER

This table gives the index of refraction of liquid water at atmospheric pressure, relative to a vacuum, at several temperatures and wavelengths. It is generated from the formulation in Reference 1, which covers a wide range of temperature, pressure, and wavelength. The wavelengths listed here correspond to prominent lines of cadmium (226.50 and 361.05 nm), potassium (404.41 nm), sodium (589.00 nm), Ne (632.80 nm, from a helium - neon laser), and mercury (1.01398 μm).

INDEX OF REFRACTION OF LIQUIDS FOR CALIBRATION PURPOSES

This table gives the index of refraction of six liquids which are available in highly pure form and whose index of refraction has been accurately measured as a function of wavelength and temperature. They are therefore useful for calibration of refractometers. The estimated uncertainty in the values is:

2,2,4-Trimethylpentane	±0.00003
Hexadecane	±0.00008
<i>trans</i> -Bicyclo[4.0.0]decane	±0.00008
1-Methylnaphthalene	±0.00008
Toluene	±0.00003
Methylcyclohexane	±0.00003

Full details are given in the references. This table is reprinted from Reference 1 by permission of the International Union of Pure and Applied Chemistry.

INDEX OF REFRACTION OF AIR

This is a table of the index of refraction n of dry air at 15°C and a pressure of 101.325 kPa and containing 0.045% by volume of carbon dioxide (“standard air”). The index of refraction is defined by $n = \lambda_{\text{vac}} / \lambda_{\text{air}}$ where λ is the wavelength of the radiation. The index is calculated from the expression

$$(n-1) \times 10^8 = 8342.54 + 2406147(130 - \sigma^2)^{-1} + 15998(38.9 - \sigma^2)^{-1}$$

where $\sigma = 1/\lambda_{\text{vac}}$ and λ_{vac} has units of μm . The equation is valid for λ_{vac} from 200 nm to 2 μm . The table also gives the correction $(n-1)\lambda_{\text{air}}$ which must be added to the wavelength in air to obtain λ_{vac} .

If the air is at a temperature t in °C (ITS-90) and a pressure p in pascals, a value of $(n - 1)$ from this table should be multiplied by

$$p[1 + p(60.1 - 0.972t) \times 10^{-10}]/96095.43(1 + 0.003661t)$$

CHARACTERISTICS OF LASER SOURCES

William F. Krupke

Light Amplification by Stimulated Emission of Radiation was first demonstrated by Maiman in 1960, the result of a population inversion produced between energy levels of chromium ions in a ruby crystal when irradiated with a xenon flashlamp. Since then population inversions and coherent emission have been generated in literally thousands of substances (neutral and ionized gases, liquids, and solids) using a variety of incoherent excitation techniques (optical pumping, electrical discharges, gas-dynamic flow, electron-beams, chemical reactions, nuclear decay).

The extrema of laser output parameters which have been demonstrated to date and the laser media used are summarized in Table 1. Note that the extreme power and energy parameters listed in this table were attained with laser *systems* rather than with simple laser oscillators.

Laser sources are commonly classified in terms of the state-of-matter of the active medium: gas, liquid, and solid. Each of these classes is further subdivided into one or more types as shown in Table 2. A well-known representative example of each type of laser is also given in Table 2 together with its nominal operation wavelength and the methods by which it is pumped.

The various lasers together cover a wide spectral range from the far ultraviolet to the far infrared. The particular wavelength of emission (usually a narrow line) is presented for some six dozen lasers in Figures 1A and 1B.

By suitably designing the excitation source and/or by controlling the laser resonator structure, laser systems can provide continuous or pulsed radiation as shown in Table 3.

Besides the method of excitation and the temporal behavior of a laser, there are many other parameters that characterize its operation and efficiency, as shown in Tables 4 and 5.

Although many lasers only emit in one or more narrow spectral "lines", an increasing number of lasers can be tuned by changing the composition or the pressure of the medium, or by varying the wavelength of the pump bands. The spectral regions in which these tunable lasers operate are presented in Figure 2.

TABLE 1. Extrema of Output Parameters of Laser Devices or Systems

Parameter	Value	Laser medium
Peak power	1×10^{14} W (collimated)	Nd:glass
Peak power density	10^{18} W/cm ² (focused)	Nd:glass
Pulse energy	$>10^5$ J	CO ₂ , Nd:glass
Average power	10^5 W	CO ₂
Pulse duration	3×10^{-15} s continuous wave (cw)	Rh6G dye; various gases, liquids, solids
Wavelength	60 nm \leftrightarrow 385 μ m	Many required
Efficiency (nonlaser pumped)	70%	CO
Beam quality	Diffraction limited	Various gases, liquids, solids
Spectral linewidth	20 Hz (for 10^{-1} s)	Neon-helium
Spatial coherence	10 m	Ruby

TABLE 2. Classes, Types, and Representative Examples of Laser Sources

Class	Type (characteristic)	Representative example	Nominal operating wavelength (nm)	Method(s) of excitation
Gas	Atom, neutral (electronic transition)	Neon-Helium (Ne-He)	633	Glow discharge
	Atom, ionic (electronic transition)	Argon (Ar ⁺)	488	Arc discharge
	Molecule, neutral (electronic transition)	Krypton fluoride (KrF)	248	Glow discharge; e-beam
	Molecule, neutral (vibrational transition)	Carbon dioxide (CO ₂)	10600	Glow discharge; gasdynamic flow
	Molecule, neutral (rotational transition)	Methyl fluoride (CH ₃ F)	496000	Laser pumping
Liquid	Molecule, ionic (electronic transition)	Nitrogen ion (N ₂ ⁺)	420	E-beam
	Organic solvent (dye-chromophore)	Rhodamine dye (Rh6G)	580–610	Flashlamp; laser pumping
	Organic solvent (rare earth chelate)	Europium:TTF	612	Flashlamp
	Inorganic solvent (trivalent rare earth ion)	Neodymium:POCl ₄	1060	Flashlamp
Solid	Insulator, crystal (impurity)	Neodymium:YAG	1064	Flashlamp, arc lamp
	Insulator, crystal (stoichiometric)	Neodymium:UP(NdP ₅ O ₁₄)	1052	Flashlamp
	Insulator, crystal (color center)	F ₂ ⁻ :LiF	1120	Laser pumping
	Insulator, amorphous (impurity)	Neodymium:glass	1061	Flashlamp
	Semiconductor (p-n junction)	GaAs	820	Injection current
	Semiconductor (electron-hole plasma)	GaAs	890	E- beam, laser pumping

TABLE 3. Temporal Characteristics of Lasers and Laser Systems

Form	Technique	Pulse width range (s)
Continuous wave	Excitation is continuous; resonator Q is held constant at some moderate value	∞
Pulsed	Excitation is pulsed; resonator Q is held constant at some moderate value	$10^{-8} - 10^{-3}$
Q-Switched	Excitation is continuous or pulsed; resonator Q is switched from a very low value to a moderate value	$10^{-8} - 10^{-6}$
Cavity dumped	Excitation is continuous or pulsed; resonator Q is switched from a very high value to a low value	$10^{-7} - 10^{-5}$
Mode locked	Excitation is continuous or pulsed; phase or loss of the resonator modes is modulated at a rate related to the resonator transit time	$10^{-12} - 10^{-9}$

INFRARED LASER FREQUENCIES

Arthur Maki

The CO₂ laser has been the subject of a number of very accurate frequency measurements. Most of the earlier measurements are given by Bradley et al.¹ That analysis was based on a single absolute frequency measurement and many laser frequency differences. New measurements of the methane frequency²⁻⁴ have made it necessary to slightly revise that single absolute frequency measurement. In addition, there have been several other absolute frequency measurements⁵⁻⁷ that have been used here to improve the accuracy of the present tables. New frequency difference measurements have also been added to the database used for the present tables.⁸

INFRARED AND FAR-INFRARED ABSORPTION FREQUENCY STANDARDS

Arthur Maki

Aside from the CO₂ laser transitions, the absorption spectrum of CO has been more accurately and thoroughly measured than any other spectrum. A bibliography of earlier measurements on CO is given by Maki and Wells,¹ and the present tables were calculated from the measurements referred to in that work. In addition, some new and very accurate frequency measurements^{2,3} have been made and were incorporated in the present tables. The frequencies of the rotational transitions of HF and HCl were calculated from constants obtained from fitting the measurements of Evenson et al.^{4,5} and Jennings and Wells.⁶

A new report on infrared wavenumber standards from the International Union of Pure and Applied Chemistry, Commission on Molecular Structure and Spectroscopy, may be found in Reference 7.

SENSITIVITY OF THE HUMAN EYE TO LIGHT OF DIFFERENT WAVELENGTHS

The human eye responds to electromagnetic radiation in the wavelength range from about 360 nm (violet) to 820 nm (red), with a peak sensitivity near 555 nm. While the detailed shape of this response curve depends on the individual person, studies on representative samples of human subjects have led to adoption of a standard function relating the perceived brightness (luminous flux) to the actual power of the spectral radiation. This function is referred to as $V(\lambda)$, the photopic spectral luminous efficiency function, and it plays an important role in photometry.

The function $V(\lambda)$, as adopted by the International Commission on Illumination (CIE) is tabulated and plotted below.

INDEX OF REFRACTION OF INORGANIC CRYSTALS

This table lists the index of refraction of selected crystalline inorganic compounds. When, available, values are give as a function of wavelength in the range from the ultraviolet to the far infrared region. For each compound a value at 589 nm, the wavelength of the principal sodium line, is given. The data have been taken from the references indicated; in many cases, data from a reference have been refitted to generate the index of refraction at the wavelengths used in this table. All values refer to ambient temperature. Entries marked by * are based on extrapolation beyond the range of available experimental data.

Compounds belonging to the cubic crystal system have only a single refractive index value, but other systems are anisotropic, so that the crystal is characterized by two or three unique indexes. Hexagonal, rhombohedral, and tetragonal crystals have two unique indexes which are traditionally labeled n_o and n_e for "ordinary ray" and "extraordinary ray". Orthorhombic, monoclinic, and triclinic crystals are characterized by three indexes which are here called n_x , n_y , and n_z . The table indicates the crystal system for each entry in order to identify the material uniquely.

The refractive index and other optical properties for metals, semiconductors, and certain other compounds can be found in the tables "Optical Properties of Selected Elements" and "Optical Properties of Selected Inorganic and Organic Solids" in Section 12 of this *Handbook*.

PROTON AFFINITIES

Proton affinity is a useful parameter for describing gas phase ion-molecule reactions in fields such as atmospheric chemistry, plasma chemistry, mass spectrometry, and astrophysics. The proton affinity E_{pa} (often designated in the literature as PA) of a molecular species M is defined as the negative of the enthalpy change for the gas phase reaction

A closely related quantity is the gas phase basicity $\Delta_{\text{base}} G^\circ$ (often designated as GB), which is the negative of the Gibbs energy change for the same reaction. Thus the two are related by

$$\Delta_{\text{base}} G^\circ = E_{\text{pa}} + T\Delta S,$$

where T is the temperature and ΔS is the entropy change in the reaction (which can be calculated if the molecular structure of M and M^+ is known).

Direct measurement of the proton affinity is possible for only a few molecules, mainly olefins and carbonyl compounds. However, these measurements have been used to establish a scale of E_{pa} values that permits proton affinities to be determined for many other molecules, including unstable species and reaction intermediates. The basis for this scale is described by Hunter and Lias in Reference 1.

The E_{pa} and $\Delta_{\text{base}} G^\circ$ values at a temperature of 298 K are tabulated below for selected molecules. Many values are given to one decimal place, but the majority are not accurate to better than one or two kilojoules per mole. The methods of measurement are de-

scribed in Reference 1, which contains a much more extensive and detailed tabulation.

Compounds are listed by molecular formula in the Hill order, but with all compounds that do not contain carbon appearing before those that do contain carbon.

Higgs Bosons — H^0 and H^{\pm} , Searches for

H^0 Mass $m > 77.5$ GeV CL = 95%

H_1^0 In Supersymmetric Models ($m_{H_1^0} < m_{H_2^0}$)

Mass $m > 62.5$ GeV CL = 95%

A^0 Pseudoscalar Higgs Boson in Supersymmetric Models [1]

Mass $m > 62.5$ GeV CL = 95% $\tan\beta > 1$

H^{\pm} Mass $m > 54.5$ GeV CL = 95%

See the Particle Listings for a Note giving details of Higgs Bosons.

Heavy Bosons Other Than Higgs Bosons, Searches for

Additional W Bosons

W_R — right-handed W

Mass $m > 549$ GeV

(assuming light right-handed neutrino)

W' with standard couplings decaying to $e\nu\tau\mu\nu$

Mass $m > 720$ GeV CL = 95%

Additional Z Bosons

Z_{SM} with standard couplings

Mass $m > 690$ GeV CL = 95% ($p\bar{p}$ direct search)

Mass $m > 779$ GeV CL = 95% (electroweak fit)

Z_{LR} of $SU(2)_L \times SU(2)_R \times U(1)$

(with $g_L = g_R$)

Mass $m > 630$ GeV CL = 95% ($p\bar{p}$ direct search)

Mass $m > 389$ GeV CL = 95% (electroweak fit)

Z_χ of $SO(10) \rightarrow SU(5) \times U(1)_\chi$

(coupling constant derived from G.U.T.)

Mass $m > 595$ GeV CL = 95% ($p\bar{p}$ direct search)

Mass $m > 321$ GeV CL = 95% (electroweak fit)

Z_ψ of $E_6 \rightarrow SO(10) \times U(1)_\psi$

(coupling constant derived from G.U.T.)

Mass $m > 590$ GeV CL = 95% ($p\bar{p}$ direct search)

Mass $m > 160$ GeV CL = 95% (electroweak fit)

Z_η of $E_6 \rightarrow SU(3) \times SU(2) \times U(1) \times U(1)_\eta$

(coupling constant derived from G.U.T.);

charges are $Q_\eta = \sqrt{3}/8Q_\chi = \sqrt{5}/8Q_\psi$

Mass $m > 620$ GeV CL = 95% ($p\bar{p}$ direct search)

Mass $m > 182$ GeV CL = 95% (electroweak fit)

Scalar Leptoquarks

Mass $m > 225$ GeV CL = 95% (1st generation Γ pair prod.)

Mass $m > 237$ GeV CL = 95% (1st gener. Γ single prod.)

Mass $m > 119$ GeV CL = 95% (2nd gener. Γ pair prod.)

Mass $m > 73$ GeV CL = 95% (2nd gener. Γ single prod.)

Mass $m > 99$ GeV CL = 95% (3rd gener. Γ pair prod.)

(See the Particle Listings for assumptions on leptoquark quantum numbers and branching fractions.)

Axions (A^0) and Other Very Light Bosons, Searches for

The standard Peccei-Quinn axion is ruled out. Variants with reduced couplings or much smaller masses are constrained by various data. The Particle Listings in the full Review contain a Note discussing axion searches.

The best limit for the half-life of neutrinoless double beta decay with Majoron emission is $> 7.2 \times 10^{24}$ years (CL = 90%).

NOTES

In this Summary Table:

When a quantity has “(S = ...)” to its right Γ the error on the quantity has been enlarged by the “scale factor” SF defined as $S = \sqrt{\chi^2/(N-1)\Gamma}$ where N is the number of measurements used in calculating the quantity. We do this when $S > 1\Gamma$ which often indicates that the measurements are inconsistent. When $S > 1.25\Gamma$ we also show in the Particle Listings an ideogram of the measurements. For more about SF see the Introduction.

A decay momentum p is given for each decay mode. For a 2-body decay p is the momentum of each decay product in the rest frame of the decaying particle. For a 3-or-more-body decay p is the largest momentum any of the products can have in this frame.

- [a] Theoretical value. A mass as large as a few MeV may not be precluded.
- [b] ℓ indicates each type of lepton ($e\Gamma\mu\Gamma$ and $\tau\Gamma$) not sum over them.
- [c] The Z -boson mass listed here corresponds to a Breit-Wigner resonance parameter. It lies approximately 34 MeV above the real part of the position of the pole (in the energy-squared plane) in the Z -boson propagator.
- [d] This partial width takes into account Z decays into $\nu\bar{\nu}$ and any other possible undetected modes.
- [e] This ratio has not been corrected for the τ mass.
- [f] Here $A \equiv 2g_V g_A / (g_V^2 + g_A^2)$.
- [g] The value is for the sum of the charge states of particle/antiparticle states indicated.
- [h] See the Z Particle Listings for the γ energy range used in this measurement.
- [i] For $m_{\gamma\gamma} = (60 \pm 5)$ GeV.
- [j] The limits assume no invisible decays.

Heavy Charged Lepton Searches

L^\pm – charged lepton

Mass $m > 80.2$ GeV, CL = 95% $m_\nu \approx 0$

L^\pm – stable charged heavy lepton

Mass $m > 84.2$ GeV, CL = 95%

Neutrinos

See the Particle Listings for a Note “Neutrino Mass” giving details of neutrinos, masses, mixing, and the status of experimental searches.

ν_e

$$J = \frac{1}{2}$$

Mass m : Unexplained effects have resulted in significantly negative m^2 in the new, precise tritium beta decay experiments. It is felt that a real neutrino mass as large as 10–15 eV would cause observable spectral distortions even in the presence of the end-point count excesses.

Mean life/mass, $\tau/m_{\nu_e} > 7 \times 10^9$ s/eV (solar)

Mean life/mass, $\tau/m_{\nu_e} > 300$ s/eV, CL = 90% (reactor)

Magnetic moment $\mu < 1.8 \times 10^{-10} \mu_B$, CL = 90%

ν_μ

$$J = \frac{1}{2}$$

Mass $m < 0.17$ MeV, CL = 90%

Mean life/mass, $\tau/m_{\nu_\mu} > 15.4$ s/eV, CL = 90%

Magnetic moment $\mu < 7.4 \times 10^{-10} \mu_B$, CL = 90%

ν_τ

$$J = \frac{1}{2}$$

Mass $m < 18.2$ MeV, CL = 95%

Magnetic moment $\mu < 5.4 \times 10^{-7} \mu_B$, CL = 90%

Electric dipole moment $d < 5.2 \times 10^{-17}$ e cm, CL = 95%

Number of Light Neutrino Types

(including ν_e , ν_μ , and ν_τ)

Number $N = 2.994 \pm 0.012$ (Standard Model fits to LEP data)

Number $N = 3.07 \pm 0.12$ (Direct measurement of invisible Z width)

Massive Neutrinos and Lepton Mixing. Searches for

For excited leptons, see Compositeness Limits below.

See the Particle Listings for a Note “Neutrino Mass” giving details of neutrinos, masses, mixing, and the status of experimental searches.

While no direct, uncontested evidence for massive neutrinos or lepton mixing has been obtained, suggestive evidence has come from solar neutrino observations, from anomalies in the relative fractions of ν_e and ν_μ observed in energetic cosmic-ray air showers, and possibly from a $\bar{\nu}_e$ appearance experiment at Los Alamos. Sample limits are:

Stable Neutral Heavy Lepton Mass Limits

Mass $m > 45.0$ GeV, CL = 95% (Dirac)

Mass $m > 39.5$ GeV, CL = 95% (Majorana)

Neutral Heavy Lepton Mass Limits

Mass $m > 69.0$ GeV, CL = 95% (Dirac ν_L coupling to e , μ , τ with $|U_{\ell j}|^2 > 10^{-12}$)

Mass $m > 58.2$ GeV, CL = 95% (Majorana ν_L coupling to e , μ , τ with $|U_{\ell j}|^2 > 10^{-12}$)

Solar Neutrinos

Detectors using gallium ($E_\nu \gtrsim 0.2$ MeV), chlorine ($E_\nu \gtrsim 0.8$ MeV), and Čerenkov effect in water ($E_\nu \gtrsim 7$ MeV) measure significantly lower neutrino rates than are predicted from solar models. The deficit in the solar neutrino flux compared with solar model calculations could be explained by oscillations with $\Delta m^2 \leq 10^{-5}$ eV² causing the disappearance of ν_e .

Atmospheric Neutrinos

Underground detectors observing neutrinos produced by cosmic rays in the atmosphere have measured a ν_μ/ν_e ratio much less than expected and also a deficiency of upward going ν_μ compared to downward. This could be explained by oscillations leading to the disappearance of ν_μ with $\Delta m^2 \approx 10^{-3}$ to 10^{-2} eV².

ν oscillation: $\bar{\nu}_e \nrightarrow \bar{\nu}_e$ (θ = mixing angle)

$\Delta m^2 < 9 \times 10^{-4}$ eV², CL = 90% (if $\sin^2 2\theta = 1$)

$\sin^2 2\theta < 0.02$, CL = 90% (if $\Delta(m^2)$ is large)

ν oscillation: $\nu_\mu (\bar{\nu}_\mu) \rightarrow \nu_e (\bar{\nu}_e)$ (any combination)

$\Delta m^2 < 0.075$ eV², CL = 90% (if $\sin^2 2\theta = 1$)

$\sin^2 2\theta < 1.8 \times 10^{-3}$, CL = 90% (if $\Delta(m^2)$ is large)

NOTES

In this Summary Table:

When a quantity has “(S = ...)” to its right, the error on the quantity has been enlarged by the “scale factor” S, defined as $S = \sqrt{\chi^2/(N-1)}$, where N is the number of measurements used in calculating the quantity. We do this when $S > 1$, which often indicates that the measurements are inconsistent. When $S > 1.25$, we also show in the Particle Listings an ideogram of the measurements. For more about S, see the Introduction.

A decay momentum p is given for each decay mode. For a 2-body decay, p is the momentum of each decay product in the rest frame of the decaying particle. For a 3-or-more-body decay, p is the largest momentum any of the products can have in this frame.

- [a] The uncertainty in the electron mass in unified atomic mass units (u) is ten times smaller than that given by the 1986 CODATA adjustment, quoted in the Table of Physical Constants (Section 1). The conversion to MeV via the factor 931.49432(28) MeV/u is more uncertain because of the electron charge uncertainty. Our value in MeV differs slightly from the 1986 CODATA result.
- [b] This is the best “electron disappearance” limit. The best limit for the mode $e^- \rightarrow \nu \gamma$ is $> 2.35 \times 10^{25}$ yr (CL=68%).
- [c] The muon mass is most precisely known in u (unified atomic mass units). The conversion factor to MeV via the factor 931.49432(28) MeV/u is more uncertain because of the electron charge uncertainty.
- [d] See the “Note on Muon Decay Parameters” in the μ Particle Listings for definitions and details.
- [e] P_μ is the longitudinal polarization of the muon from pion decay. In standard V–A theory, $P_\mu = 1$ and $\rho = \delta = 3/4$.
- [f] This only includes events with the γ energy > 10 MeV. Since the $e^- \bar{\nu}_e \nu_\mu$ and $e^- \bar{\nu}_e \nu_\mu \gamma$ modes cannot be clearly separated, we regard the latter mode as a subset of the former.
- [g] See the μ Particle Listings for the energy limits used in this measurement.
- [h] A test of additive vs. multiplicative lepton family number conservation.
- [i] Basis mode for the τ .

QUARK SUMMARY TABLE

QUARKS

The u -, d -, and s -quark masses are estimates of so-called “current-quark masses,” in a mass-independent subtraction scheme such as $\overline{\text{MS}}$ at a scale $\mu \approx 2$ GeV. The c - and b -quark masses are estimated from charmonium, bottomonium, D , and B masses. They are the “running” masses in the $\overline{\text{MS}}$ scheme. These can be different from the heavy quark masses obtained in potential models.

u	$I(J^P) = \frac{1}{2}(\frac{1}{2}^+)$
Mass $m = 1.5$ to 5 MeV ^[a] $m_u/m_d = 0.20$ to 0.70	Charge = $\frac{2}{3} e$ $I_z = +\frac{1}{2}$
d	$I(J^P) = \frac{1}{2}(\frac{1}{2}^+)$
Mass $m = 3$ to 9 MeV ^[a] $m_s/m_d = 17$ to 25 $\bar{m} = (m_u + m_d)/2 = 2$ to 6 MeV	Charge = $-\frac{1}{3} e$ $I_z = -\frac{1}{2}$
s	$I(J^P) = 0(\frac{1}{2}^+)$
Mass $m = 60$ to 170 MeV ^[a] $(m_s - (m_u + m_d)/2)/(m_d - m_u) = 34$ to 51	Charge = $-\frac{1}{3} e$ Strangeness = -1
c	$I(J^P) = 0(\frac{1}{2}^+)$
Mass $m = 1.1$ to 1.4 GeV	Charge = $\frac{2}{3} e$ Charm = $+1$

b	$I(J^P) = 0(\frac{1}{2}^+)$
Mass $m = 4.1$ to 4.4 GeV	Charge = $-\frac{1}{3} e$ Bottom = -1
t	$I(J^P) = 0(\frac{1}{2}^+)$
	Charge = $\frac{2}{3} e$ Top = $+1$
	Mass $m = 173.8 \pm 5.2$ GeV (direct observation of top events) Mass $m = 170 \pm 7 (+14)$ GeV (Standard Model electroweak fit, assuming $M_H = M_Z$. Number in parentheses is shift from changing M_H to 300 GeV.)

b' (4th Generation) Quark, Searches for

Mass $m > 128$ GeV, CL = 95% ($p\bar{p}$, charged current decays)
Mass $m > 46.0$ GeV, CL = 95% (e^+e^- , all decays)

Free Quark Searches

All searches since 1977 have had negative results.

NOTES

[a] The ratios m_u/m_d and m_s/m_d are extracted from pion and kaon masses using chiral symmetry. The estimates of u and d masses are not without controversy and remain under active investigation. Within the literature there are even suggestions that the u quark could be essentially massless. The s -quark mass is estimated from SU(3) splittings in hadron masses.

MESON SUMMARY TABLE

LIGHT UNFLAVORED MESONS ($S = C = B = 0$)

For $I = 1$ ($\pi\Gamma b\Gamma\rho\Gamma a$): $u\bar{d}\Gamma(u\bar{u}-d\bar{d})/\sqrt{2}\Gamma d\bar{u}$
for $I = 0$ ($\eta\Gamma\eta'\Gamma h\Gamma h'\Gamma\omega\Gamma\phi\Gamma f\Gamma f'$): $c_1(u\bar{u} + d\bar{d}) + c_2(s\bar{s})$

π^\pm

$$I^G(J^{PC}) = 1^-(0^-)$$

Mass $m = 139.56995 \pm 0.00035$ MeV

BOTTOM MESONS
($B = \pm 1$)

$$B^+ = u\bar{b}\Gamma B^0 = d\bar{b}\Gamma\bar{B}^0 = \bar{d}b\Gamma B^- = \bar{u}b\Gamma\bar{B}^- \quad \text{similarly for } B^{*s}$$

B-particle organization

Many measurements of B decays involve admixtures of B hadrons. Previously we arbitrarily included such admixtures in the B^\pm section but because of their importance we have created two new sections: " B^\pm/B^0 Admixture" for $\Upsilon(4S)$ results and " $B^\pm/B^0/B_s^0/b$ -baryon Admixture" for results at higher energies. Most inclusive decay branching fractions are found in the Admixture sections. $B^0\text{-}\bar{B}^0$ mixing data are found in the B^0 section while $B_s^0\text{-}\bar{B}_s^0$ mixing data and $B\text{-}\bar{B}$ mixing data for a B^0/B_s^0 admixture are found in the B_s^0 section. CP -violation data are found in the B^0 section. b -baryons are found near the end of the Baryon section.

The organization of the B sections is now as follows where bullets indicate particle sections and brackets indicate reviews.

[Production and Decay of b -flavored Hadrons]

[Semileptonic Decays of B Mesons]

- B^\pm
 - mass, mean life
 - branching fractions
- B^0
 - mass, mean life
 - branching fractions
 - polarization in B^0 decay
 - $B^0\text{-}\bar{B}^0$ mixing
 - [$B^0\text{-}\bar{B}^0$ Mixing and CP Violation in B Decay]
 - CP violation
- B^\pm/B^0 Admixtures
 - branching fractions
- $B^\pm/B^0/B_s^0/b$ -baryon Admixtures
 - mean life
 - production fractions
 - branching fractions
- B^*
 - mass
- B_s^0
 - mass, mean life
 - branching fractions
 - polarization in B_s^0 decay
 - $B_s^0\text{-}\bar{B}_s^0$ mixing
 - $B\text{-}\bar{B}$ mixing (admixture of $B^0\Gamma B_s^0$)

At end of Baryon Listings:

- Λ_b
 - mass, mean life
 - branching fractions
- b -baryon Admixture
 - mean life
 - branching fractions

B^\pm

$$I(J^P) = \frac{1}{2}(0^-)$$

$I\Gamma J^P$ need confirmation. Quantum numbers shown are quark-model predictions.

$$\text{Mass } m_{B^\pm} = 5278.9 \pm 1.8 \text{ MeV}$$

$$\text{Mean life } \tau_{B^\pm} = (1.65 \pm 0.04) \times 10^{-12} \text{ s}$$

$$c\tau = 495 \text{ } \mu\text{m}$$

B^\pm modes are charge conjugates of the modes below. Modes which do not identify the charge state of the B are listed in the B^\pm/B^0 ADMIXTURE section.

The branching fractions listed below assume 50% $B^0\bar{B}^0$ and 50% $B^\pm B^\mp$ production at the $T(4S)$. We have attempted to bring older measurements up to date by rescaling their assumed $T(4S)$ production ratio to 50:50 and their assumed $D\Gamma D_s\Gamma D^*\Gamma$ and ψ branching ratios to current values whenever this would affect our averages and best limits significantly.

Indentation is used to indicate a subchannel of a previous reaction. All resonant subchannels have been corrected for resonance branching fractions to the final state so the sum of the subchannel branching fractions can exceed that of the final state.

 B^0

$$I(J^P) = \frac{1}{2}(0^-)$$

$1I, 1I, P$ need confirmation. Quantum numbers shown are quark-model predictions.

$$\text{Mass } m_{B^0} = 5279.2 \pm 1.8 \text{ MeV}$$

$$m_{B^0} - m_{B^\pm} = 0.35 \pm 0.29 \text{ MeV} \quad (S = 1.1)$$

$$\text{Mean life } \tau_{B^0} = (1.56 \pm 0.04) \times 10^{-12} \text{ s}$$

$$c\tau = 468 \text{ } \mu\text{m}$$

$$\tau_{B^-}/\tau_{B^0} = 1.02 \pm 0.04 \quad (\text{average of direct and inferred})$$

$$\tau_{B^-}/\tau_{B^0} = 1.04 \pm 0.04 \quad (\text{direct measurements})$$

$$\tau_{B^-}/\tau_{B^0} = 0.95_{-0.12}^{+0.15} \quad (\text{inferred from branching fractions})$$

 B^0 - \bar{B}^0 mixing parameters

$$x_d = 0.172 \pm 0.010$$

$$\Delta m_{B^0} = m_{B_{H_L}^0} - m_{B_{L_L}^0} = (0.464 \pm 0.018) \times 10^{12} \text{ } \hbar \text{ s}^{-1}$$

$$x_d = \Delta m_{B^0}/\Gamma_{B^0} = 0.723 \pm 0.032$$

 CP violation parameters

$$|\text{Re}(\epsilon_{B^0})| = 0.002 \pm 0.008$$

\bar{B}^0 modes are charge conjugates of the modes below. Reactions indicate the weak decay vertex and do not include mixing. Modes which do not identify the charge state of the B are listed in the B^\pm/\bar{B}^0 ADMIXTURE section.

The branching fractions listed below assume 50% $B^0 \bar{B}^0$ and 50% $B^+ B^-$ production at the $T(4S)$. We have attempted to bring older measurements up to date by rescaling their assumed $T(4S)$ production ratio to 50:50 and their assumed $D^0 D_s^* \Gamma D^* \Gamma$ and ψ branching ratios to current values whenever this would affect our averages and best limits significantly.

Indentation is used to indicate a subchannel of a previous reaction. All resonant subchannels have been corrected for resonance branching fractions to the final state so the sum of the subchannel branching fractions can exceed that of the final state.

B^0 DECAY MODES	Fraction (Γ_i/Γ)	Scale factor/ Confidence level	p (MeV/c)

 B^\pm/B^0 ADMIXTURE

The branching fraction measurements are for an admixture of B mesons at the $\Upsilon(4S)$. The values quoted assume that $B(\Upsilon(4S) \rightarrow B \bar{B}) = 100\%$.

For inclusive branching fractions[†] e.g., $B \rightarrow D^\pm$ anything[†] the treatment of multiple D 's in the final state must be defined. One possibility would be to count the number of events with one-or-more D 's and divide by the total number of B 's. Another possibility would be to count the total number of D 's and divide by the total number of B 's[†] which is the definition of average multiplicity. The two definitions are identical when only one of the specified particles is allowed in the final state. Even though the "one-or-more" definition seems sensible for practical reasons inclusive branching fractions are almost always measured using the multiplicity definition. For heavy final state particles[†] authors call their results inclusive branching fractions while for light particles some authors call their results multiplicities. In the B sections[†] we list all results as inclusive branching fractions[†] adopting a multiplicity definition. This means that inclusive branching fractions can exceed 100% and that inclusive partial widths can exceed total widths[†] just as inclusive cross sections can exceed total cross sections.

\bar{B} modes are charge conjugates of the modes below. Reactions indicate the weak decay vertex and do not include mixing.

B DECAY MODES	Fraction (Γ_i/Γ)	Scale factor/ Confidence level	p (MeV/c)
Semileptonic and leptonic modes			
$B \rightarrow e^+ \nu_e$ anything	[ccc] $(10.41 \pm 0.29)\%$	S=1.2	-

$B^\pm/B^0/B_s^0/b$ -baryon ADMIXTURE

These measurements are for an admixture of bottom particles at high energy (LEP Tevatron $\bar{p}p$).

Mean life $\tau = (1.564 \pm 0.014) \times 10^{-12}$ s

Mean life $\tau = (1.72 \pm 0.10) \times 10^{-12}$ s Charged b -hadron admixture

Mean life $\tau = (1.58 \pm 0.14) \times 10^{-12}$ s Neutral b -hadron admixture

$\tau_{\text{charged } b\text{-hadron}}/\tau_{\text{neutral } b\text{-hadron}} = 1.09 \pm 0.13$

The branching fraction measurements are for an admixture of B mesons and baryons at energies above the $\Upsilon(4S)$. Only the highest energy results (LEP Tevatron $\bar{p}p$) are used in the branching fraction averages. The production fractions give our best current estimate of the admixture at LEP.

For inclusive branching fractions $B \rightarrow D^\pm \text{ anything}$ the treatment of multiple D 's in the final state must be defined. One possibility would be to count the number of events with one or more D 's and divide by the total number of B 's. Another possibility would be to count the total number of D 's and divide by the total number of B 's which is the definition of average multiplicity. The two definitions are identical when only one of the specified particles is allowed in the final state. Even though the "one-or-more" definition seems sensible for practical reasons inclusive branching fractions are almost always measured using the multiplicity definition. For heavy final state particles authors call their results inclusive branching fractions while for light particles some authors call their results multiplicities. In the B sections we list all results as inclusive branching fractions adopting a multiplicity definition. This means that inclusive branching fractions can exceed 100% and that inclusive partial widths can exceed total widths just as inclusive cross sections can exceed total cross sections.

The modes below are listed for a \bar{b} initial state, b modes are their charge conjugates. Reactions indicate the weak decay vertex and do not include mixing.

\bar{b} DECAY MODES	Fraction (Γ_i/Γ)	Confidence level	p (MeV/c)

PRODUCTION FRACTIONS

The production fractions for weakly decaying b -hadrons at the Z have been calculated from the best values of mean lives, mixing parameters and branching fractions in this edition by the LEP B Oscillation Working Group as described in the note "Production and Decay of b -Flavored Hadrons" in the B^\pm Particle Listings. Values assume

$$B(\bar{b} \rightarrow B^+) = B(\bar{b} \rightarrow B^0)$$

$$B(\bar{b} \rightarrow B^+) + B(\bar{b} \rightarrow B^0) + B(\bar{b} \rightarrow B_s^0) + B(b \rightarrow \Lambda_b) = 100\%$$

The notation for production fractions varies in the literature ($f_{B^0} \Gamma(b \rightarrow \bar{B}^0) \Gamma \text{Br}(b \rightarrow \bar{B}^0)$). We use our own branching fraction notation here $B(\bar{b} \rightarrow B^0)$.

B^+	(39.7 \pm 1.8) %	-

B*

$$I(J^P) = \frac{1}{2}(1^-)$$

$IJ\Gamma P$ need confirmation. Quantum numbers shown are quark-model predictions.

$$\text{Mass } m_{B^*} = 5324.9 \pm 1.8 \text{ MeV}$$

$$m_{B^*} - m_B = 45.78 \pm 0.35 \text{ MeV}$$

B* DECAY MODES	Fraction (Γ_i/Γ)	p (MeV/c)
$B\gamma$	dominant	46

BOTTOM, STRANGE MESONS ($B = \pm 1, S = \mp 1$)

$$B_s^0 = s\bar{b} \quad \bar{B}_s^0 = \bar{s}b \quad \text{similarly for } B_s^{*\mp}s$$

 B_s^0

$$I(J^P) = 0(0^-)$$

$IJ\Gamma P$ need confirmation. Quantum numbers shown are quark-model predictions.

$$\text{Mass } m_{B_s^0} = 5369.3 \pm 2.0 \text{ MeV}$$

$$\text{Mean life } \tau = (1.54 \pm 0.07) \times 10^{-12} \text{ s}$$

$$c\tau = 462 \mu\text{m}$$

B_s^0 - \bar{B}_s^0 mixing parameters

$$\chi_B \text{ at high energy} = f_d\chi_d + f_s\chi_s = 0.118 \pm 0.006$$

$$\Delta m_{B_s^0} = m_{B_s^{*H}} - m_{B_s^{*L}} > 9.1 \times 10^{12} \hbar \text{ s}^{-1} \Gamma \text{CL} = 95\%$$

$$\chi_s = \Delta m_{B_s^0}/\Gamma_{B_s^0} > 14.0 \Gamma \text{CL} = 95\%$$

$$\chi_s > 0.4975 \Gamma \text{CL} = 95\%$$

These branching fractions all scale with $B(\bar{b} \rightarrow B_s^0)\Gamma$ the LEP B_s^0 production fraction. The first four were evaluated using $B(\bar{b} \rightarrow B_s^0) = (10.5^{+1.8}_{-1.7})\%$ and the rest assume $B(\bar{b} \rightarrow B_s^0) = 12\%$.

The branching fraction $B(B_s^0 \rightarrow D_s^- \ell^+ \nu_\ell \text{ anything})$ is not a pure measurement since the measured product branching fraction $B(\bar{b} \rightarrow B_s^0) \times B(B_s^0 \rightarrow D_s^- \ell^+ \nu_\ell \text{ anything})$ was used to determine $B(\bar{b} \rightarrow B_s^0)\Gamma$ as described in the note on "Production and Decay of b -Flavored Hadrons."

In this Summary Table:

When a quantity has “(S = ...)” to its right the error on the quantity has been enlarged by the “scale factor” SF defined as $S = \sqrt{\chi^2/(N-1)}$ where N is the number of measurements used in calculating the quantity. We do this when $S > 1$ which often indicates that the measurements are inconsistent. When $S > 1.25$ we also show in the Particle Listings an ideogram of the measurements. For more about SF see the Introduction.

A decay momentum p is given for each decay mode. For a 2-body decay p is the momentum of each decay product in the rest frame of the decaying particle. For a 3-or-more-body decay p is the largest momentum any of the products can have in this frame.

[a] See the “Note on $\pi^\pm \rightarrow \ell^\pm \nu \gamma$ and $K^\pm \rightarrow \ell^\pm \nu \gamma$ Form Factors” in the π^\pm Particle Listings for definitions and details.

[b] Measurements of $\Gamma(e^+ \nu_e)/\Gamma(\mu^+ \nu_\mu)$ always include decays with γ ’s and measurements of $\Gamma(e^+ \nu_e \gamma)$ and $\Gamma(\mu^+ \nu_\mu \gamma)$ never include low-energy γ ’s. Therefore since no clean separation is possible we consider the modes with γ ’s to be subreactions of the modes without them and let $[\Gamma(e^+ \nu_e) + \Gamma(\mu^+ \nu_\mu)]/\Gamma_{\text{total}} = 100\%$.

[c] See the π^\pm Particle Listings for the energy limits used in this measurement; low-energy γ ’s are not included.

[d] Derived from an analysis of neutrino-oscillation experiments.

[e] Astrophysical and cosmological arguments give limits of order 10^{-13} ; see the π^0 Particle Listings.

[f] See the “Note on the Decay Width $\Gamma(\eta \rightarrow \gamma \gamma)$ ” in our 1994 edition Phys. Rev. **D50** 1 August 1994 Part II p. 1451.

[g] C parity forbids this to occur as a single-photon process.

[h] See the “Note on scalar mesons” in the $f_0(1370)$ Particle Listings. The interpretation of this entry as a particle is controversial.

[i] See the “Note on $\rho(770)$ ” in the $\rho(770)$ Particle Listings.

[j] The e^+e^- branching fraction is from $e^+e^- \rightarrow \pi^+\pi^-$ experiments only. The $\omega\rho$ interference is then due to $\omega\rho$ mixing only and is expected to be small. If $e\mu$ universality holds $\Gamma(\rho^0 \rightarrow \mu^+\mu^-) = \Gamma(\rho^0 \rightarrow e^+e^-) \times 0.99785$.

[k] See the “Note on scalar mesons” in the $f_0(1370)$ Particle Listings.

[l] See the “Note on $a_1(1260)$ ” in the $a_1(1260)$ Particle Listings.

[m] This is only an educated guess; the error given is larger than the error on the average of the published values. See the Particle Listings for details.

[n] See the “Note on the $f_1(1420)$ ” in the $\eta(1440)$ Particle Listings.

[o] See also the $\omega(1600)$ Particle Listings.

[p] See the “Note on the $\eta(1440)$ ” in the $\eta(1440)$ Particle Listings.

[q] See the “Note on the $\rho(1450)$ and the $\rho(1700)$ ” in the $\rho(1700)$ Particle Listings.

[r] See the “Note on non- $q\bar{q}$ mesons” in the Particle Listings (see the index for the page number).

[s] See also the $\omega(1420)$ Particle Listings.

[t] See the “Note on $f_J(1710)$ ” in the $f_J(1710)$ Particle Listings.

[u] See the note in the K^\pm Particle Listings.

[v] The definition of the slope parameter g of the $K \rightarrow 3\pi$ Dalitz plot is as follows (see also “Note on Dalitz Plot Parameters for $K \rightarrow 3\pi$ Decays” in the K^\pm Particle Listings):

$$|M|^2 = 1 + g(s_3 - s_0)/m_{\pi^-}^2 + \dots$$

- [w] For more details and definitions of parameters see the Particle Listings.
- [x] See the K^\pm Particle Listings for the energy limits used in this measurement.
- [y] Most of this radiative mode's low-momentum γ part is also included in the parent mode listed without γ 's.
- [z] Direct-emission branching fraction.
- [aa] Structure-dependent part.
- [bb] Derived from measured values of $\phi_{+-}\Gamma\phi_{00}\Gamma|\eta|\Gamma|m_{K_L^0} - m_{K_S^0}|\Gamma$ and $\tau_{K_S^0}\Gamma$ as described in the introduction to "Tests of Conservation Laws."
- [cc] The CP -violation parameters are defined as follows (see also "Note on CP Violation in $K_S \rightarrow 3\pi$ " and "Note on CP Violation in K_L^0 Decay" in the Particle Listings):
- $$\eta_{+-} = |\eta_{+-}|e^{i\phi_{+-}} = \frac{A(K_L^0 \rightarrow \pi^+\pi^-)}{A(K_S^0 \rightarrow \pi^+\pi^-)} = \epsilon + \epsilon'$$
- $$\eta_{00} = |\eta_{00}|e^{i\phi_{00}} = \frac{A(K_L^0 \rightarrow \pi^0\pi^0)}{A(K_S^0 \rightarrow \pi^0\pi^0)} = \epsilon - 2\epsilon'$$
- $$\delta = \frac{\Gamma(K_L^0 \rightarrow \pi^-\ell^+\nu) - \Gamma(K_L^0 \rightarrow \pi^+\ell^-\nu)}{\Gamma(K_L^0 \rightarrow \pi^-\ell^+\nu) + \Gamma(K_L^0 \rightarrow \pi^+\ell^-\nu)} \Gamma$$
- $$\text{Im}(\eta_{+-0})^2 = \frac{\Gamma(K_S^0 \rightarrow \pi^+\pi^-\pi^0)^{CP \text{ viol.}}}{\Gamma(K_L^0 \rightarrow \pi^+\pi^-\pi^0)} \Gamma$$
- $$\text{Im}(\eta_{000})^2 = \frac{\Gamma(K_S^0 \rightarrow \pi^0\pi^0\pi^0)}{\Gamma(K_L^0 \rightarrow \pi^0\pi^0\pi^0)}.$$
- where for the last two relations CPT is assumed valid i.e., $\text{Re}(\eta_{+-0}) \simeq 0$ and $\text{Re}(\eta_{000}) \simeq 0$.
- [dd] See the K_S^0 Particle Listings for the energy limits used in this measurement.
- [ee] Calculated from K_L^0 semileptonic rates and the K_S^0 lifetime assuming $\Delta S = \Delta Q$.
- [ff] ϵ'/ϵ is derived from $|\eta_{00}/\eta_{+-}|$ measurements using theoretical input on phases.
- [gg] The value is for the sum of the charge states of particle/antiparticle states indicated.
- [hh] See the K_L^0 Particle Listings for the energy limits used in this measurement.
- [ii] Allowed by higher-order electroweak interactions.
- [jj] Violates CP in leading order. Test of direct CP violation since the indirect CP -violating and CP -conserving contributions are expected to be suppressed.
- [kk] See the "Note on $f_0(1370)$ " in the $f_0(1370)$ Particle Listings and in the 1994 edition.
- [ll] See the note in the $L(1770)$ Particle Listings in Reviews of Modern Physics 56 No. 2 Pt. II (1984) p. S200. See also the "Note on $K_2(1770)$ and the $K_2(1820)$ " in the $K_2(1770)$ Particle Listings.
- [mm] See the "Note on $K_2(1770)$ and the $K_2(1820)$ " in the $K_2(1770)$ Particle Listings.
- [nn] This is a weighted average of D^\pm (44%) and D^0 (56%) branching fractions. See " D^+ and $D^0 \rightarrow (\eta \text{ anything}) / (\text{total } D^+ \text{ and } D^0)$ " under " D^+ Branching Ratios" in the Particle Listings.
- [oo] This value averages the e^+ and μ^+ branching fractions after making a small phase-space adjustment to the μ^+ fraction to be able to use it as an e^+ fraction; hence our ℓ^+ here is really an e^+ .
- [pp] An ℓ indicates an e or a μ mode not a sum over these modes.
- [qq] The branching fraction for this mode may differ from the sum of the submodes that contribute to it due to interference effects. See the relevant papers in the Particle Listings.
- [rr] The two experiments measuring this fraction are in serious disagreement. See the Particle Listings.
- [ss] This mode is not a useful test for a $\Delta C=1$ weak neutral current because both quarks must change flavor in this decay.
- [tt] The D_1^0 - D_2^0 limits are inferred from the D^0 - \bar{D}^0 mixing ratio $\Gamma(K^+\ell^-\bar{\nu}_\ell \text{ (via } \bar{D}^0)) / \Gamma(K^-\ell^+\nu_\ell)$.
- [uu] The larger limit (from E791) allows interference between the doubly Cabibbo-suppressed and mixing amplitudes; the smaller limit (from E691) doesn't. See the papers for details.
- [vv] The experiments on the division of this charge mode amongst its submodes disagree and the submode branching fractions here add up to considerably more than the charged-mode fraction.
- [ww] However these upper limits are in serious disagreement with values obtained in another experiment.
- [xx] For now we average together measurements of the $X e^+ \nu_e$ and $X \mu^+ \nu_\mu$ branching fractions. This is the average not the sum.
- [yy] This branching fraction includes all the decay modes of the final-state resonance.
- [zz] This value includes only K^+K^- decays of the $f_2(1710)$ because branching fractions of this resonance are not known.
- [aaa] This value includes only $\pi^+\pi^-$ decays of the $f_0(1500)$ because branching fractions of this resonance are not known.
- [bbb] B^0 and B_s^0 contributions not separated. Limit is on weighted average of the two decay rates.
- [ccc] These values are model dependent. See "Note on Semileptonic Decays" in the B^+ Particle Listings.
- [ddd] D^{**} stands for the sum of the $D(1^1P_1)\Gamma D(1^3P_0)\Gamma D(1^3P_1)\Gamma D(1^3P_2)\Gamma D(2^1S_0)\Gamma$ and $D(2^1S_1)$ resonances.
- [eee] Inclusive branching fractions have a multiplicity definition and can be greater than 100%.
- [fff] D_j represents an unresolved mixture of pseudoscalar and tensor D^{**} (P -wave) states.
- [ggg] Not a pure measurement. See note at head of B_s^0 Decay Modes.
- [hhh] Includes $p\bar{p}\pi^+\pi^-\gamma$ and excludes $p\bar{p}\eta\Gamma p\bar{p}\omega\Gamma p\bar{p}\eta'$.
- [iii] J^{PC} known by production in e^+e^- via single photon annihilation. f_G is not known; interpretation of this state as a single resonance is unclear because of the expectation of substantial threshold effects in this energy region.
- [jjj] Spectroscopic labeling for these states is theoretical pending experimental information.

See also the table of suggested $q\bar{q}$ quark-model assignments in the Quark Model section.

- Indicates particles that appear in the preceding Meson Summary Table. We do not regard the other entries as being established.

† Indicates that the value of J given is preferred, but needs confirmation.

BARYON SUMMARY TABLE

This short table gives the name, the quantum numbers (where known), and the status of baryons in the Review. Only the baryons with 3- or 4-star status are included in the main Baryon Summary Table. Due to insufficient data or uncertain interpretation, the other entries in the short table are not established as baryons. The names with masses are of baryons that decay strongly. See our 1986 edition (Physics Letters **170B**) for listings of evidence for Z baryons (KN resonances).

**** Existence is certain, and properties are at least fairly well explored.

*** Existence ranges from very likely to certain, but further confirmation is desirable and/or quantum numbers, branching fractions, etc. are not well determined.

** Evidence of existence is only fair.

* Evidence of existence is poor.

N BARYONS ($S = 0$, $I = 1/2$)

$$p\Gamma N^+ = uud; \quad n\Gamma N^0 = udd$$

P

$$I(J^P) = \frac{1}{2}(\frac{1}{2}^+)$$

Mass $m = 938.27231 \pm 0.00028$ MeV [a]
 $= 1.007276470 \pm 0.000000012$ u
 $|q_p/m_p|/(q_p/m_p) = 1.0000000015 \pm 0.0000000011$
 $|q_p + q_{\bar{p}}|/e < 2 \times 10^{-5}$
 $|q_p + q_e|/e < 1.0 \times 10^{-21}$ [b]
Magnetic moment $\mu = 2.79284739 \pm 0.000000006 \mu_N$
Electric dipole moment $d = (-4 \pm 6) \times 10^{-23}$ ecm
Electric polarizability $\alpha = (12.1 \pm 0.9) \times 10^{-4}$ fm³
Magnetic polarizability $\beta = (2.1 \pm 0.9) \times 10^{-4}$ fm³
Mean life $\tau > 1.6 \times 10^{25}$ years (independent of mode)
 $> 10^{31}$ to 5×10^{32} years [c] (mode dependent)

Below Γ for N decays Γ and n distinguish proton and neutron partial lifetimes. See also the "Note on Nucleon Decay" in our 1994 edition (Phys. Rev. D50 1673) for a short review.

The "partial mean life" limits tabulated here are the limits on τ/B_i where τ is the total mean life and B_i is the branching fraction for the mode in question.

p DECAY MODES	Partial mean life (10^{10} years)	Confidence level	p (MeV/c)
Antilepton + meson			
$N \rightarrow e^+ \pi$	> 130 ($n\Gamma > 550$ (p))	90%	459
$N \rightarrow \mu^+ \pi$	> 100 ($n\Gamma > 270$ (p))	90%	453

$$\Lambda \pi^+ \quad \alpha = -0.98 \pm 0.19$$

$$\Sigma^+ \pi^0 \quad \alpha = -0.45 \pm 0.32$$

$$\Lambda \ell^+ \nu_\ell \quad \alpha = -0.82^{+0.11}_{-0.07}$$

Nearly all branching fractions of the Λ_c^+ are measured relative to the $pK^- \pi^+$ model but there are no model-independent measurements of this branching fraction. We explain how we arrive at our value of $B(\Lambda_c^+ \rightarrow pK^- \pi^+)$ in a Note at the beginning of the branching-ratio measurements in the Listings. When this branching fraction is eventually well determined all the other branching fractions will slide up or down proportionally as the true value differs from the value we use here.

BOTTOM BARYONS ($B = -1$)

$$\Lambda_b^0 = udb\bar{u} \Xi_b^0 = usb\bar{u} \Xi_b^- = dsb$$

$$I(J^P) = 0(\frac{1}{2}^+)$$

$I(J^P)$ not yet measured; $0(\frac{1}{2}^+)$ is the quark model prediction.

Mass $m = 5624 \pm 9$ MeV ($S = 1.8$)
 Mean life $\tau = (1.24 \pm 0.08) \times 10^{-12}$ s
 $c\tau = 372$ μ m

These branching fractions are actually an average over weakly decaying b -baryons weighted by their production rates in Z^0 decay (or high-energy $p\bar{p}$) Γ branching ratios and detection efficiencies. They scale with the LEP Λ_b production fraction $B(b \rightarrow \Lambda_b)$ and are evaluated for our value $B(b \rightarrow \Lambda_b) = (10.1^{+3.9}_{-3.1})\%$.

The branching fractions $B(b\text{-baryon} \rightarrow \Lambda_c^- \bar{\nu}_\ell \text{anything})$ and $B(\Lambda_b^0 \rightarrow \Lambda_c^+ \ell^- \bar{\nu}_\ell \text{anything})$ are not pure measurements because the underlying measured products of these with $B(b \rightarrow \Lambda_b)$ were used to determine $B(b \rightarrow \Lambda_b) \Gamma$ as described in the note "Production and Decay of b -Flavored Hadrons."

NOTES

This Summary Table only includes established baryons. The Particle Listings include evidence for other baryons. The masses, widths and branching fractions for the resonances in this Table are Breit-Wigner parameters but pole positions are also given for most of the N and Δ resonances.

For most of the resonances the parameters come from various partial-wave analyses of more or less the same sets of data and it is not appropriate to treat the results of the analyses as independent or to average them together. Furthermore the systematic errors on the results are not well understood. Thus we usually only give ranges for the parameters. We then also give a best guess for the mass (as part of the name of the resonance) and for the width. The Note on N and Δ Resonances and the Note on Λ and Σ Resonances in the Particle Listings review the partial-wave analyses.

When a quantity has " $(S = \dots)$ " to its right the error on the quantity has been enlarged by the "scale factor" $S\Gamma$ defined as $S = \sqrt{\lambda^2/(N-1)\Gamma}$ where N is the number of measurements used in calculating the quantity. We do this when $S > 1\Gamma$ which often indicates that the measurements are inconsistent. When $S > 1.25\Gamma$ we also show in the Particle Listings an ideogram of the measurements. For more about $S\Gamma$ see the Introduction.

A decay momentum p is given for each decay mode. For a 2-body decay p is the momentum of each decay product in the rest frame of the decaying particle. For a 3-or-more-body decay p is the largest momentum any of the products can have in this frame. For any resonance the nominal mass is used in calculating p . A dagger ("†") in this column indicates that the mode is forbidden when the nominal masses of resonances are used but is in fact allowed due to the nonzero widths of the resonances.

[a] The masses of the p and n are most precisely known in u (unified atomic mass units). The conversion factor to MeV $1\text{ u} = 931.49432 \pm 0.00028$ MeV is less well known than are the masses in u.

[b] The limit is from neutrality-of-matter experiments; it assumes $q_n = q_p + q_e$. See also the charge of the neutron.

[c] The first limit is geochemical and independent of decay mode. The second entry a range of limits assumes the dominant decay modes are among those investigated. For antiprotons the best limit inferred from the observation of cosmic ray \bar{p} 's is $\tau_{\bar{p}} > 10^7$ yr if the cosmic-ray storage time but this limit depends on a number of assumptions. The best direct observation of stored antiprotons gives $\tau_{\bar{p}}/B(\bar{p} \rightarrow e^- \gamma) > 1848$ yr.

[d] There is some controversy about whether nuclear physics and model dependence complicate the analysis for bound neutrons (from which the best limit comes). The second limit here is from reactor experiments with free neutrons.

[e] The parameters $g_A \Gamma_{gV} \Gamma$ and $g_{WM} \Gamma$ for semileptonic modes are defined by $\bar{B}_f [\gamma_\lambda (g_V + g_A \gamma_5) + i(g_{WM}/m_B) \sigma_{\lambda\nu} q^\nu] B_i \Gamma$ and ϕ_{AV} is defined by $g_A/g_V = |g_A/g_V| e^{i\phi_{AV}}$. See the "Note on Baryon Decay Parameters" in the neutron Particle Listings.

[f] Time-reversal invariance requires this to be 0° or 180° .

[g] The decay parameters γ and Δ are calculated from α and ϕ using

$$\gamma = \sqrt{1-\alpha^2} \cos \phi \quad \tan \Delta = -\frac{1}{\alpha} \sqrt{1-\alpha^2} \sin \phi.$$

See the "Note on Baryon Decay Parameters" in the neutron Particle Listings.

[h] See the Particle Listings for the pion momentum range used in this measurement.

[i] The error given here is only an educated guess. It is larger than the error on the weighted average of the published values.

[j] A theoretical value using QED.

[k] See the "Note on Λ_c^+ Branching Fractions" in the Branching Fractions of the Λ_c^+ Particle Listings.

[l] This branching fraction includes all the decay modes of the final-state resonance.

[m] An ℓ indicates an e or a μ model not a sum over these modes.

[n] The value is for the sum of the charge states of particle/antiparticle states indicated.

[o] Assuming isospin conservation so that the other third is $\Lambda_c^+ \pi^0 \pi^0$.

[p] Not a pure measurement. See note at head of Λ_b^0 Decay Modes.

SEARCHES SUMMARY TABLE

MONOPOLES, SUPERSYMMETRY, COMPOSITENESS, etc., SEARCHES FOR

Magnetic Monopole Searches

Isolated supermassive monopole candidate events have not been confirmed. The most sensitive experiments obtain negative results.

Best cosmic-ray supermassive monopole flux limit:
 $< 1.0 \times 10^{-15} \text{ cm}^{-2}\text{sr}^{-1}\text{s}^{-1}$ for $1.1 \times 10^{-4} < \beta < 0.1$

Supersymmetric Particle Searches

Limits are based on the Minimal Supersymmetric Standard Model.

Assumptions include: 1) $\tilde{\chi}_1^0$ (or $\tilde{\gamma}$) is lightest supersymmetric particle; 2) R -parity is conserved; 3) All scalar quarks (except \tilde{t}_L and \tilde{t}_R) are degenerate in mass, and $m_{\tilde{q}_R} = m_{\tilde{q}_L}$. 4) Limits for selectrons and smuons refer to the $\tilde{\ell}_R$ states.

See the Particle Listings for a Note giving details of supersymmetry.

$\tilde{\chi}_i^0$ — neutralinos (mixtures of $\tilde{\gamma}$, \tilde{Z}^0 , and \tilde{H}_i^0)

Mass $m_{\tilde{\chi}_1^0} > 10.9 \text{ GeV}$, CL = 95%

Mass $m_{\tilde{\chi}_2^0} > 45.3 \text{ GeV}$, CL = 95% [tan $\beta > 1$]

Mass $m_{\tilde{\chi}_3^0} > 75.8 \text{ GeV}$, CL = 95% [tan $\beta > 1$]

Mass $m_{\tilde{\chi}_4^0} > 127 \text{ GeV}$, CL = 95% [tan $\beta > 3$]

$\tilde{\chi}_i^\pm$ — charginos (mixtures of \tilde{W}^\pm and \tilde{H}_i^\pm)

Mass $m_{\tilde{\chi}_1^\pm} > 65.7 \text{ GeV}$, CL = 95% [$m_{\tilde{\chi}_2^\pm} - m_{\tilde{\chi}_1^\pm} \geq 2 \text{ GeV}$]

Mass $m_{\tilde{\chi}_2^\pm} > 99 \text{ GeV}$, CL = 95% [GUT relations assumed]

$\tilde{\nu}$ — scalar neutrino (sneutrino)

Mass $m > 37.1 \text{ GeV}$, CL = 95% [one flavor]

Mass $m > 43.1 \text{ GeV}$, CL = 95% [three degenerate flavors]

\tilde{e} — scalar electron (selectron)

Mass $m > 58 \text{ GeV}$, CL = 95% [$m_{\tilde{e}_R} - m_{\tilde{\chi}_1^0} \geq 4 \text{ GeV}$]

$\tilde{\mu}$ — scalar muon (smuon)

Mass $m > 55.6 \text{ GeV}$, CL = 95% [$m_{\tilde{\mu}_R} - m_{\tilde{\chi}_1^0} \geq 4 \text{ GeV}$]

$\tilde{\tau}$ — scalar tau (stau)

Mass $m > 45 \text{ GeV}$, CL = 95% [if $m_{\tilde{\chi}_1^0} < 38 \text{ GeV}$]

\tilde{q} — scalar quark (squark)

These limits include the effects of cascade decays, evaluated assuming a fixed value of the parameters μ and tan β . The limits are weakly sensitive to these parameters over much of parameter space. Limits assume GUT relations between gaugino masses and the gauge coupling; in particular that for $|\mu|$ not small, $m_{\tilde{\chi}_1^0} \approx m_{\tilde{g}}/6$.

Mass $m > 176 \text{ GeV}$, CL = 95% [any $m_{\tilde{g}} < 300 \text{ GeV}$, $\mu = -250 \text{ GeV}$, tan $\beta = 2$]

Mass $m > 224 \text{ GeV}$, CL = 95% [$m_{\tilde{g}} \leq m_{\tilde{q}}$, $\mu = -400 \text{ GeV}$, tan $\beta = 4$]

\tilde{g} — gluino

There is some controversy on whether gluinos in a low-mass window ($1 \lesssim m_{\tilde{g}} \lesssim 5 \text{ GeV}$) are excluded or not. See the Supersymmetry Listings for details.

The limits summarised here refer to the high-mass region ($m_{\tilde{g}} \gtrsim 5 \text{ GeV}$), and include the effects of cascade decays, evaluated assuming a fixed value of the parameters μ and tan β .

The limits are weakly sensitive to these parameters over much of parameter space. Limits assume GUT relations between gaugino masses and the gauge coupling; in particular that for $|\mu|$ not small, $m_{\tilde{\chi}_1^0} \approx m_{\tilde{g}}/6$.

Mass $m > 173 \text{ GeV}$, CL = 95% [any $m_{\tilde{q}}, \mu = -200 \text{ GeV}$, tan $\beta = 2$]

Mass $m > 212 \text{ GeV}$, CL = 95% [$m_{\tilde{g}} \geq m_{\tilde{q}}, \mu = -250 \text{ GeV}$, tan $\beta = 2$]

Quark and Lepton Compositeness, Searches for

Scale Limits Λ for Contact Interactions

(the lowest dimensional interactions with four fermions)

If the Lagrangian has the form

$$\pm \frac{g^2}{2\Lambda^2} \bar{\psi}_L \gamma_\mu \psi_L \bar{\psi}_L \gamma^\mu \psi_L$$

(with $g^2/4\pi$ set equal to 1), then we define $\Lambda \equiv \Lambda_{LL}^\pm$. For the full definitions and for other forms, see the Note in the Listings on Searches for Quark and Lepton Compositeness in the full Review and the original literature.

$\Lambda_{LL}^+(eeee) > 2.4 \text{ TeV}$, CL = 95%

$\Lambda_{LL}^-(eeee) > 3.6 \text{ TeV}$, CL = 95%

$\Lambda_{LL}^+(ee\mu\mu) > 2.6 \text{ TeV}$, CL = 95%

$\Lambda_{LL}^-(ee\mu\mu) > 2.9 \text{ TeV}$, CL = 95%

$\Lambda_{LL}^+(ee\tau\tau) > 1.9 \text{ TeV}$, CL = 95%

$\Lambda_{LL}^-(ee\tau\tau) > 3.0 \text{ TeV}$, CL = 95%

$\Lambda_{LL}^+(\ell\ell\ell\ell) > 3.5 \text{ TeV}$, CL = 95%

$\Lambda_{LL}^-(\ell\ell\ell\ell) > 3.8 \text{ TeV}$, CL = 95%

$\Lambda_{LL}^+(eeqq) > 2.5 \text{ TeV}$, CL = 95%

$\Lambda_{LL}^-(eeqq) > 3.7 \text{ TeV}$, CL = 95%

$\Lambda_{LL}^+(eebb) > 3.1 \text{ TeV}$, CL = 95%

$\Lambda_{LL}^-(eebb) > 2.9 \text{ TeV}$, CL = 95%

$\Lambda_{LL}^+(\mu\mu qq) > 2.9 \text{ TeV}$, CL = 95%

$\Lambda_{LL}^-(\mu\mu qq) > 4.2 \text{ TeV}$, CL = 95%

$\Lambda_{LR}^\pm(\nu_\mu \nu_e \mu e) > 3.1 \text{ TeV}$, CL = 90%

$\Lambda_{LL}^\pm(qqqq) > 1.6 \text{ TeV}$, CL = 95%

Excited Leptons

The limits from $\ell^{*+} \ell^{*-}$ do not depend on λ (where λ is the $\ell\ell^{*}$ transition coupling). The λ -dependent limits assume chiral coupling, except for the third limit for e^* which is for nonchiral coupling. For chiral coupling, this limit corresponds to $\lambda_\gamma = \sqrt{2}$.

$e^{*\pm}$ — excited electron

Mass $m > 85.0 \text{ GeV}$, CL = 95% (from $e^{*+} e^{*-}$)

Mass $m > 91 \text{ GeV}$, CL = 95% (if $\lambda_Z > 1$)

Mass $m > 194 \text{ GeV}$, CL = 95% (if $\lambda_\gamma = 1$)

$\mu^{*\pm}$ — excited muon

Mass $m > 85.3 \text{ GeV}$, CL = 95% (from $\mu^{*+} \mu^{*-}$)

Mass $m > 91 \text{ GeV}$, CL = 95% (if $\lambda_Z > 1$)

$\tau^{*\pm}$ — excited tau

Mass $m > 84.6 \text{ GeV}$, CL = 95% (from $\tau^{*+} \tau^{*-}$)

Mass $m > 90 \text{ GeV}$, CL = 95% (if $\lambda_Z > 0.18$)

ν^* — excited neutrino

Mass $m > 84.9 \text{ GeV}$, CL = 95% (from $\nu^* \bar{\nu}^*$)

Mass $m > 91 \text{ GeV}$, CL = 95% (if $\lambda_Z > 1$)

Mass $m = \text{none } 40\text{--}96 \text{ GeV}$, CL = 95% (from $e p \rightarrow \nu^* X$)

q^* — excited quark

Mass $m > 45.6 \text{ GeV}$, CL = 95% (from $q^* \bar{q}^*$)

Mass $m > 88 \text{ GeV}$, CL = 95% (if $\lambda_Z > 1$)

Mass $m > 570 \text{ GeV}$, CL = 95% ($p \bar{p} \rightarrow q^* X$)

Color Sextet and Octet Particles

Color Sextet Quarks (q_6)

Mass $m > 84 \text{ GeV}$, CL = 95% (Stable q_6)

Color Octet Charged Leptons (ℓ_8)

Mass $m > 86 \text{ GeV}$, CL = 95% (Stable ℓ_8)

Color Octet Neutrinos (ν_8)

Mass $m > 110 \text{ GeV}$, CL = 90% ($\nu_8 \rightarrow \nu g$)

TESTS OF CONSERVATION LAWS

TESTS OF CONSERVATION LAWS

Revised by L. Wolfenstein and T.G. Trippe May 1998.

In keeping with the current interest in tests of conservation laws we collect together a Table of experimental limits on all weak and electromagnetic decays, mass differences, and moments, and on a few reactions whose observation would violate conservation laws. The Table is given only in the full *Review of Particle Physics* not in the Particle Physics Booklet. For the benefit of Booklet readers we include the best limits from the Table in the following text. Limits in this text are for CL=90% unless otherwise specified. The Table is in two parts: "Discrete Space-Time Symmetries" i.e. Γ CTPTTCPT and CPT ; and "Number Conservation Laws" i.e. Γ lepton Γ baryon Γ hadronic flavor Γ and charge conservation. The references for these data can be found in the the Particle Listings in the *Review*. A discussion of these tests follows.

CPT INVARIANCE

General principles of relativistic field theory require invariance under the combined transformation CPT . The simplest tests of CPT invariance are the equality of the masses and lifetimes of a particle and its antiparticle. The best test comes from the limit on the mass difference between K^0 and \bar{K}^0 . Any such difference contributes to the CP -violating parameter ϵ . Assuming CPT invariance $\Gamma\phi_e$ the phase of ϵ should be very close to 44° . (See the "Note on CP Violation in K_L^0 Decay" in the Particle Listings.) In contrast if the entire source of CP violation in K^0 decays were a $K^0 - \bar{K}^0$ mass difference $\Gamma\phi_e$ would be $44^\circ + 90^\circ$. Assuming that there is no other source of CPT violation than this mass difference it is possible to deduce that [1]

$$m_{\bar{K}^0} - m_{K^0} \approx \frac{2(m_{K_L^0} - m_{K_S^0})|\eta|(\frac{2}{3}\phi_{+-} + \frac{1}{3}\phi_{00} - \phi_0)}{\sin\phi_0},$$

where $\phi_0 = 43.5^\circ$ with an uncertainty of less than 0.1° . Using our best values of the CP -violation parameters we get $|(m_{\bar{K}^0} - m_{K^0})/m_{K^0}| \leq 10^{-18}$. Limits can also be placed on specific CPT -violating decay amplitudes. Given the small value of $(1 - |\eta_{00}/\eta_{+-}|)$ the value of $\phi_{00} - \phi_{+-}$ provides a measure of CPT violation in $K_L^0 \rightarrow 2\pi$ decay. Results from CERN [1] and Fermilab [2] indicate no CPT -violating effect.

CP AND T INVARIANCE

Given CPT invariance ΓCP violation and T violation are equivalent. So far the only evidence for CP or T violation comes from the measurements of $\eta_{+-}\Gamma\eta_{00}$ and the semileptonic decay charge asymmetry for $K_L \Gamma e.g. \Gamma\eta_{+-} = |A(K_L^0 \rightarrow \pi^+\pi^-)/A(K_S^0 \rightarrow \pi^+\pi^-)| = (2.285 \pm 0.019) \times 10^{-3}$ and $[\Gamma(K_L^0 \rightarrow \pi^-e^+\nu) - \Gamma(K_L^0 \rightarrow \pi^+e^-\bar{\nu})]/[\text{sum}] = (0.333 \pm 0.014)\%$. Other searches for CP or T violation divide into (a) those that involve weak interactions or parity violation and (b) those that involve processes otherwise allowed by the strong or electromagnetic interactions. In class (a) the most sensitive are probably the searches for an electric dipole moment of the neutron measured to be $< 1.0 \times 10^{-25}$ e cm and the electron $(-0.18 \pm 0.16) \times 10^{-26}$ e cm. A nonzero value requires both P and T violation. Class (b) includes the search for C violation in η decay believed to be an electromagnetic process $\Gamma e.g. \Gamma$ as measured by $\Gamma(\eta \rightarrow \mu^+\mu^-\pi^0)/\Gamma(\eta \rightarrow \text{all}) < 5 \times 10^{-6}$ and searches for T violation in a number of nuclear and electromagnetic reactions.

CONSERVATION OF LEPTON NUMBERS

Present experimental evidence and the standard electroweak theory are consistent with the absolute conservation of three separate lepton numbers: electron number L_e , muon number L_μ and tau number L_τ . Searches for violations are of the following types:

a) $\Delta L = 2$ for one type of lepton. The best limit comes from the search for neutrinoless double beta decay $(Z, A) \rightarrow (Z+2, A) + e^- + e^-$. The best laboratory limit is $t_{1/2} > 1.1 \times 10^{25}$ yr (CL=90%) for ^{76}Ge .

b) Conversion of one lepton type to another. For purely leptonic processes the best limits are on $\mu \rightarrow e\gamma$ and $\mu \rightarrow 3e$ measured as $\Gamma(\mu \rightarrow e\gamma)/\Gamma(\mu \rightarrow \text{all}) < 5 \times 10^{-11}$ and $\Gamma(\mu \rightarrow 3e)/\Gamma(\mu \rightarrow \text{all}) < 1.0 \times 10^{-12}$. For semileptonic processes the best limit comes from the coherent conversion process in a muonic atom $\Gamma\mu^- + (Z, A) \rightarrow e^- + (Z, A) \Gamma$ measured as $\Gamma(\mu^- \text{Ti} \rightarrow e^- \text{Ti})/\Gamma(\mu^- \text{Ti} \rightarrow \text{all}) < 4 \times 10^{-12}$. Of special interest is the case in which the hadronic flavor also changes Γ as in $K_L \rightarrow e\mu$ and $K^+ \rightarrow \pi^+e^-\Gamma$ measured as $\Gamma(K_L \rightarrow e\mu)/\Gamma(K_L \rightarrow \text{all}) < 3.3 \times 10^{-11}$ and $\Gamma(K^+ \rightarrow \pi^+e^-\mu^+)/\Gamma(K^+ \rightarrow \text{all}) < 2.1 \times 10^{-10}$. Limits on the conversion of τ into e or μ are found in τ decay and are much less stringent than those for $\mu \rightarrow e$ conversion $\Gamma e.g. \Gamma(\tau \rightarrow \mu\gamma)/\Gamma(\tau \rightarrow \text{all}) < 3.0 \times 10^{-6}$ and $\Gamma(\tau \rightarrow e\gamma)/\Gamma(\tau \rightarrow \text{all}) < 2.7 \times 10^{-6}$.

c) Conversion of one type of lepton into another type of antilepton. The case most studied is $\mu^- + (Z, A) \rightarrow e^+ + (Z-2, A) \Gamma$ the strongest limit being $\Gamma(\mu^- \text{Ti} \rightarrow e^+ \text{Ca})/\Gamma(\mu^- \text{Ti} \rightarrow \text{all}) < 9 \times 10^{-11}$.

d) Relation to neutrino mass. If neutrinos have mass then it is expected even in the standard electroweak theory that the lepton numbers are not separately conserved as a consequence of lepton mixing analogous to Cabibbo quark mixing. However in this case lepton-number-violating processes such as $\mu \rightarrow e\gamma$ are expected to have extremely small probability. For small neutrino masses the lepton-number violation would be observed first in neutrino oscillations which have been the subject of extensive experimental searches. For example searches for $\bar{\nu}_e$ disappearance which we label as $\bar{\nu}_e \not\rightarrow \bar{\nu}_e$ give measured limits $\Delta(m^2) < 9 \times 10^{-4} \text{ eV}^2$ for $\sin^2(2\theta) = 1$ and $\sin^2(2\theta) < 0.02$ for large $\Delta(m^2)$ where θ is the neutrino mixing angle. Possible evidence for mixing has come from two sources. The deficit in the solar neutrino flux compared with solar model calculations could be explained by oscillations with $\Delta(m^2) \leq 10^{-5} \text{ eV}^2$ causing the disappearance of ν_e . In addition underground detectors observing neutrinos produced by cosmic rays in the atmosphere have measured a ν_μ/ν_e ratio much less than expected and also a deficiency of upward going ν_μ compared to downward. This could be explained by oscillations leading to the disappearance of ν_μ with $\Delta(m^2)$ of the order $10^{-2}-10^{-3} \text{ eV}^2$.

CONSERVATION OF HADRONIC FLAVORS

In strong and electromagnetic interactions hadronic flavor is conserved i.e. the conversion of a quark of one flavor (d, u, s, c, b, t) into a quark of another flavor is forbidden. In the Standard Model the weak interactions violate these conservation laws in a manner described by the Cabibbo-Kobayashi-Maskawa mixing (see the section "Cabibbo-Kobayashi-Maskawa Mixing Matrix"). The way in which these conservation laws are violated is tested as follows:

a) $\Delta S = \Delta Q$ rule. In the semileptonic decay of strange particles the strangeness change equals the change in charge of the hadrons. Tests come from limits on decay rates such as

$\Gamma(\Sigma^+ \rightarrow ne^+\nu)/\Gamma(\Sigma^+ \rightarrow \text{all}) < 5 \times 10^{-6}$ and from a detailed analysis of $K_L \rightarrow \pi e \nu$ which yields the parameter x measured to be $(\text{Re } x \Gamma \text{Im } x) = (0.006 \pm 0.018 \Gamma - 0.003 \pm 0.026)$. Corresponding rules are $\Delta C = \Delta Q$ and $\Delta B = \Delta Q$.

b) **Change of flavor by two units.** In the Standard Model this occurs only in second-order weak interactions. The classic example is $\Delta S = 2$ via $K^0 - \bar{K}^0$ mixing which is directly measured by $m(K_S) - m(K_L) = (3.489 \pm 0.009) \times 10^{-12}$ MeV. There is now evidence for $B^0 - \bar{B}^0$ mixing ($\Delta B = 2$) with the corresponding mass difference between the eigenstates $(m_{B_H^0} - m_{B_L^0}) = (0.723 \pm 0.032) \Gamma_{B^0} = (3.05 \pm 0.12) \times 10^{-10}$ MeV and for $B_s^0 - \bar{B}_s^0$ mixing with $(m_{B_{sH}^0} - m_{B_{sL}^0}) > 14 \Gamma_{B_s^0}$ or $> 6 \times 10^{-9}$ MeV (CL=95%). No evidence exists for $D^0 - \bar{D}^0$ mixing which is expected to be much smaller in the Standard Model.

c) **Flavor-changing neutral currents.** In the Standard Model the neutral-current interactions do not change flavor. The low rate $\Gamma(K_L \rightarrow \mu^+ \mu^-)/\Gamma(K_L \rightarrow \text{all}) = (7.2 \pm 0.5) \times 10^{-9}$ puts limits on such interactions; the nonzero value for this rate is attributed to a combination of the weak and electromagnetic interactions. The best test should come from $K^+ \rightarrow \pi^+ \nu \bar{\nu}$ which occurs in the Standard Model only as a second-order weak process with a branching fraction of $(1 \text{ to } 8) \times 10^{-10}$. Observation of one event has been reported [4] yielding $\Gamma(K^+ \rightarrow \pi^+ \nu \bar{\nu})/\Gamma(K^+ \rightarrow \text{all}) = (4.2^{+9.7}_{-3.5}) \times 10^{-10}$. Limits for charm-changing or bottom-changing neutral currents are much less stringent: $\Gamma(D^0 \rightarrow \mu^+ \mu^-)/\Gamma(D^0 \rightarrow \text{all}) < 4 \times 10^{-6}$ and $\Gamma(B^0 \rightarrow \mu^+ \mu^-)/\Gamma(B^0 \rightarrow \text{all}) < 7 \times 10^{-7}$. One cannot isolate flavor-changing neutral current (FCNC) effects in non leptonic decays. For example the FCNC transition $s \rightarrow d + (\bar{u} + u)$ is equivalent to the charged-current transition $s \rightarrow u + (\bar{u} + d)$. Tests for FCNC are therefore limited to hadron decays into lepton pairs. Such decays are expected only in second-order in the electroweak coupling in the Standard Model.

TESTS OF NUMBER CONSERVATION LAWS

LEPTON FAMILY NUMBER

Lepton family number conservation means separate conservation of each of L_e, L_μ, L_τ .

$\Gamma(Z \rightarrow e^\pm \mu^\mp) / \Gamma_{\text{total}}$	[h] $< 1.7 \times 10^{-6} \Gamma_{\text{CL}} = 95\%$
$\Gamma(Z \rightarrow e^\pm \tau^\mp) / \Gamma_{\text{total}}$	[h] $< 9.8 \times 10^{-6} \Gamma_{\text{CL}} = 95\%$
$\Gamma(Z \rightarrow \mu^\pm \tau^\mp) / \Gamma_{\text{total}}$	[h] $< 1.2 \times 10^{-5} \Gamma_{\text{CL}} = 95\%$
limit on $\mu^- \rightarrow e^-$ conversion	
$\sigma(\mu^- 32S \rightarrow e^- 32S) / \sigma(\mu^- 32S \rightarrow \nu_\mu 32P^*)$	$< 7 \times 10^{-11} \Gamma_{\text{CL}} = 90\%$
$\sigma(\mu^- \text{Ti} \rightarrow e^- \text{Ti}) / \sigma(\mu^- \text{Ti} \rightarrow \text{capture})$	$< 4.3 \times 10^{-12} \Gamma_{\text{CL}} = 90\%$
$\sigma(\mu^- \text{Pb} \rightarrow e^- \text{Pb}) / \sigma(\mu^- \text{Pb} \rightarrow \text{capture})$	$< 4.6 \times 10^{-11} \Gamma_{\text{CL}} = 90\%$
limit on muonium \rightarrow antimuonium conversion $R_g = G_C / G_F$	
	$< 0.018 \Gamma_{\text{CL}} = 90\%$
$\Gamma(\mu^- \rightarrow e^- \nu_e \bar{\nu}_\mu) / \Gamma_{\text{total}}$	[i] $< 1.2 \times 10^{-2} \Gamma_{\text{CL}} = 90\%$
$\Gamma(\mu^- \rightarrow e^- \gamma) / \Gamma_{\text{total}}$	$< 4.9 \times 10^{-11} \Gamma_{\text{CL}} = 90\%$
$\Gamma(\mu^- \rightarrow e^- e^+ e^-) / \Gamma_{\text{total}}$	$< 1.0 \times 10^{-12} \Gamma_{\text{CL}} = 90\%$
$\Gamma(\mu^- \rightarrow e^- 2\gamma) / \Gamma_{\text{total}}$	$< 7.2 \times 10^{-11} \Gamma_{\text{CL}} = 90\%$
$\Gamma(\tau^- \rightarrow e^- \gamma) / \Gamma_{\text{total}}$	$< 2.7 \times 10^{-6} \Gamma_{\text{CL}} = 90\%$
$\Gamma(\tau^- \rightarrow \mu^- \gamma) / \Gamma_{\text{total}}$	$< 3.0 \times 10^{-6} \Gamma_{\text{CL}} = 90\%$
$\Gamma(\tau^- \rightarrow e^- \pi^0) / \Gamma_{\text{total}}$	$< 3.7 \times 10^{-6} \Gamma_{\text{CL}} = 90\%$
$\Gamma(\tau^- \rightarrow \mu^- \pi^0) / \Gamma_{\text{total}}$	$< 4.0 \times 10^{-6} \Gamma_{\text{CL}} = 90\%$
$\Gamma(\tau^- \rightarrow e^- K^0) / \Gamma_{\text{total}}$	$< 1.3 \times 10^{-3} \Gamma_{\text{CL}} = 90\%$
$\Gamma(\tau^- \rightarrow \mu^- K^0) / \Gamma_{\text{total}}$	$< 1.0 \times 10^{-3} \Gamma_{\text{CL}} = 90\%$
$\Gamma(\tau^- \rightarrow e^- \eta) / \Gamma_{\text{total}}$	$< 8.2 \times 10^{-6} \Gamma_{\text{CL}} = 90\%$
$\Gamma(\tau^- \rightarrow \mu^- \eta) / \Gamma_{\text{total}}$	$< 9.6 \times 10^{-6} \Gamma_{\text{CL}} = 90\%$
$\Gamma(\tau^- \rightarrow e^- \rho^0) / \Gamma_{\text{total}}$	$< 2.0 \times 10^{-6} \Gamma_{\text{CL}} = 90\%$
$\Gamma(\tau^- \rightarrow \mu^- \rho^0) / \Gamma_{\text{total}}$	$< 6.3 \times 10^{-6} \Gamma_{\text{CL}} = 90\%$
$\Gamma(\tau^- \rightarrow e^- K^*(892)^0) / \Gamma_{\text{total}}$	$< 5.1 \times 10^{-6} \Gamma_{\text{CL}} = 90\%$
$\Gamma(\tau^- \rightarrow \mu^- K^*(892)^0) / \Gamma_{\text{total}}$	$< 7.5 \times 10^{-6} \Gamma_{\text{CL}} = 90\%$
$\Gamma(\tau^- \rightarrow e^- \bar{K}^*(892)^0) / \Gamma_{\text{total}}$	$< 7.4 \times 10^{-6} \Gamma_{\text{CL}} = 90\%$
$\Gamma(\tau^- \rightarrow \mu^- \bar{K}^*(892)^0) / \Gamma_{\text{total}}$	$< 7.5 \times 10^{-6} \Gamma_{\text{CL}} = 90\%$
$\Gamma(\tau^- \rightarrow e^- \phi) / \Gamma_{\text{total}}$	$< 6.9 \times 10^{-6} \Gamma_{\text{CL}} = 90\%$
$\Gamma(\tau^- \rightarrow \mu^- \phi) / \Gamma_{\text{total}}$	$< 7.0 \times 10^{-6} \Gamma_{\text{CL}} = 90\%$

BARYON NUMBER

$\Gamma(\tau^- \rightarrow \bar{\nu} \gamma)/\Gamma_{\text{total}}$	$<2.9 \times 10^{-4} \Gamma_{\text{CL}} = 90\%$
$\Gamma(\tau^- \rightarrow \bar{\nu} \pi^0)/\Gamma_{\text{total}}$	$<6.6 \times 10^{-4} \Gamma_{\text{CL}} = 90\%$
$\Gamma(\tau^- \rightarrow \bar{\nu} \eta)/\Gamma_{\text{total}}$	$<1.30 \times 10^{-3} \Gamma_{\text{CL}} = 90\%$
p mean life	$>1.6 \times 10^{25}$ years

A few examples of proton or bound neutron decay follow. For limits on many other nucleon decay channels see the Baryon Summary Table.

$\pi(N \rightarrow e^+ \pi)$	$>130 (n) \Gamma > 550 (p) \times 10^{30}$ years $\Gamma_{\text{CL}} = 90\%$
$\pi(N \rightarrow \mu^+ \pi)$	$>100 (n) \Gamma > 270 (p) \times 10^{30}$ years $\Gamma_{\text{CL}} = 90\%$
$\pi(N \rightarrow e^+ K)$	$>1.3 (n) \Gamma > 150 (p) \times 10^{30}$ years $\Gamma_{\text{CL}} = 90\%$
$\pi(N \rightarrow \mu^+ K)$	$>1.1 (n) \Gamma > 120 (p) \times 10^{30}$ years $\Gamma_{\text{CL}} = 90\%$
limit on $n\bar{n}$ oscillations (bound n)	[m] $>1.2 \times 10^8 \text{ s} \Gamma_{\text{CL}} = 90\%$
limit on $n\bar{n}$ oscillations (free n)	$>0.86 \times 10^8 \text{ s} \Gamma_{\text{CL}} = 90\%$

Limits are given at the 90% confidence level while errors are given as ± 1 standard deviation.

ELECTRIC CHARGE (Q)

$$\begin{aligned} e \text{ mean life / branching fraction} & [n] > 4.3 \times 10^{23} \text{ yr } \Gamma_{\text{CL}} = 68\% \\ \Gamma(n \rightarrow p \nu_e \bar{\nu}_e) / \Gamma_{\text{total}} & < 8 \times 10^{-27} \Gamma_{\text{CL}} = 68\% \end{aligned}$$

 $\Delta S = \Delta Q$ RULE

Allowed in second-order weak interactions.

$$\begin{aligned} \Gamma(K^+ \rightarrow \pi^+ \pi^+ e^- \bar{\nu}_e) / \Gamma_{\text{total}} & < 1.2 \times 10^{-8} \Gamma_{\text{CL}} = 90\% \\ \Gamma(K^+ \rightarrow \pi^+ \pi^+ \mu^- \bar{\nu}_\mu) / \Gamma_{\text{total}} & < 3.0 \times 10^{-6} \Gamma_{\text{CL}} = 95\% \\ x = \Lambda(K^0 \rightarrow \pi^- \ell^+ \nu) / \Lambda(K^0 \rightarrow \pi^- \ell^+ \nu) = \Lambda(\Delta S = -\Delta Q) / \Lambda(\Delta S = \Delta Q) \\ \text{real part of } x & 0.006 \pm 0.018 \text{ (S = 1.3)} \\ \text{imaginary part of } x & -0.003 \pm 0.026 \text{ (S = 1.2)} \\ \Gamma(\Sigma^+ \rightarrow n \ell^+ \nu) / \Gamma(\Sigma^- \rightarrow n \ell^- \bar{\nu}) & < 0.043 \\ \Gamma(\Sigma^+ \rightarrow n e^+ \nu_e) / \Gamma_{\text{total}} & < 5 \times 10^{-6} \Gamma_{\text{CL}} = 90\% \\ \Gamma(\Sigma^+ \rightarrow n \mu^+ \nu_\mu) / \Gamma_{\text{total}} & < 3.0 \times 10^{-5} \Gamma_{\text{CL}} = 90\% \\ \Gamma(\Xi^0 \rightarrow \Sigma^- e^+ \nu_e) / \Gamma_{\text{total}} & < 9 \times 10^{-4} \Gamma_{\text{CL}} = 90\% \\ \Gamma(\Xi^0 \rightarrow \Sigma^- \mu^+ \nu_\mu) / \Gamma_{\text{total}} & < 9 \times 10^{-4} \Gamma_{\text{CL}} = 90\% \end{aligned}$$

 $\Delta S = 2$ FORBIDDEN

Allowed in second-order weak interactions.

$$\begin{aligned} \Gamma(\Xi^0 \rightarrow p \pi^-) / \Gamma_{\text{total}} & < 4 \times 10^{-5} \Gamma_{\text{CL}} = 90\% \\ \Gamma(\Xi^0 \rightarrow p e^- \bar{\nu}_e) / \Gamma_{\text{total}} & < 1.3 \times 10^{-3} \\ \Gamma(\Xi^0 \rightarrow p \mu^- \bar{\nu}_\mu) / \Gamma_{\text{total}} & < 1.3 \times 10^{-3} \\ \Gamma(\Xi^- \rightarrow n \pi^-) / \Gamma_{\text{total}} & < 1.9 \times 10^{-5} \Gamma_{\text{CL}} = 90\% \\ \Gamma(\Xi^- \rightarrow n e^- \bar{\nu}_e) / \Gamma_{\text{total}} & < 3.2 \times 10^{-3} \Gamma_{\text{CL}} = 90\% \\ \Gamma(\Xi^- \rightarrow n \mu^- \bar{\nu}_\mu) / \Gamma_{\text{total}} & < 1.5 \times 10^{-2} \Gamma_{\text{CL}} = 90\% \\ \Gamma(\Xi^- \rightarrow p \pi^- \pi^-) / \Gamma_{\text{total}} & < 4 \times 10^{-4} \Gamma_{\text{CL}} = 90\% \\ \Gamma(\Xi^- \rightarrow p \pi^- e^- \bar{\nu}_e) / \Gamma_{\text{total}} & < 4 \times 10^{-4} \Gamma_{\text{CL}} = 90\% \\ \Gamma(\Xi^- \rightarrow p \pi^- \mu^- \bar{\nu}_\mu) / \Gamma_{\text{total}} & < 4 \times 10^{-4} \Gamma_{\text{CL}} = 90\% \\ \Gamma(\Omega^- \rightarrow \Lambda \pi^-) / \Gamma_{\text{total}} & < 1.9 \times 10^{-4} \Gamma_{\text{CL}} = 90\% \end{aligned}$$

 $\Delta S = 2$ VIA MIXING

Allowed in second-order weak interactions, e.g. mixing.

$$\begin{aligned} m_{K_L^0} - m_{K_S^0} & (0.5301 \pm 0.0014) \times 10^{10} \text{ s}^{-1} \\ m_{K_L^0} - m_{K_S^0} & (3.489 \pm 0.009) \times 10^{-12} \text{ MeV} \end{aligned}$$

 $\Delta C = 2$ VIA MIXING

Allowed in second-order weak interactions, e.g. mixing.

$$\begin{aligned} |m_{D_1^0} - m_{D_2^0}| & [o] < 24 \times 10^{10} \text{ s}^{-1} \Gamma_{\text{CL}} = 90\% \\ |\Gamma_{D_1^0} - \Gamma_{D_2^0}| / \Gamma_{D^0} \text{ mean life} & [o] < 0.20 \Gamma_{\text{CL}} = 90\% \\ \text{difference/average} & & \\ \Gamma(K^+ \ell^- \bar{\nu}_\ell \text{ (via } \bar{D}^0)) / \Gamma(K^- \ell^+ \nu_\ell) & < 0.005 \Gamma_{\text{CL}} = 90\% \\ \Gamma(K^+ \pi^- \text{ or } K^+ \pi^- \pi^+ \pi^- \text{ (via } \bar{D}^0)) / & [p] < 0.0085 \text{ (or } < 0.0037) \Gamma_{\text{CL}} = 90\% \\ \Gamma(K^- \pi^+ \text{ or } K^- \pi^+ \pi^+ \pi^-) & & \\ \Gamma(D^0 \rightarrow K^+ \ell^- \bar{\nu}_\ell \text{ (via } \bar{D}^0)) / \Gamma_{\text{total}} & < 1.7 \times 10^{-4} \Gamma_{\text{CL}} = 90\% \\ \Gamma(D^0 \rightarrow K^+ \pi^- \text{ or } K^+ \pi^- \pi^+ \pi^- \text{ (via } \bar{D}^0)) / \Gamma_{\text{total}} & < 1.0 \times 10^{-3} \Gamma_{\text{CL}} = 90\% \end{aligned}$$

$\Gamma(B_S^0 \rightarrow \phi \nu \bar{\nu})/\Gamma_{\text{total}}$	$< 5.4 \times 10^{-3} \Gamma_{\text{CL}} = 90\%$

In this Summary Table:

When a quantity has “(S = ...)” to its right the error on the quantity has been enlarged by the “scale factor” SF defined as $S = \sqrt{\chi^2/(N-1)}$ where N is the number of measurements used in calculating the quantity. We do this when $S > 1$ which often indicates that the measurements are inconsistent. When $S > 1.25$ we also show in the Particle Listings an ideogram of the measurements. For more about SF see the Introduction.

- [a] C parity forbids this to occur as a single-photon process.
- [b] Time-reversal invariance requires this to be 0° or 180° .
- [c] Allowed by higher-order electroweak interactions.
- [d] Violates CP in leading order. Test of direct CP violation since the indirect CP-violating and CP-conserving contributions are expected to be suppressed.
- [e] ϵ'/ϵ is derived from $|\eta_{00}/\eta_{+-}|$ measurements using theoretical input on phases.
- [f] Neglecting photon channels. See e.g. Γ.A. Pais and S.B. Treiman Phys. Rev. **D12** 2744 (1975).
- [g] Derived from measured values of $\phi_{+-} \Gamma \phi_{00} \Gamma |\eta| \Gamma |m_{K_S^0} - m_{K_L^0}| \Gamma$ and $\tau_{K_S^0} \Gamma$ as described in the introduction to “Tests of Conservation Laws.”
- [h] The value is for the sum of the charge states of particle/antiparticle states indicated.
- [i] A test of additive vs. multiplicative lepton family number conservation.
- [j] $\Delta(m^2) = 100 \text{ eV}^2$.
- [k] $190 \text{ eV}^2 < \Delta(m^2) < 320 \text{ eV}^2$.
- [l] Derived from an analysis of neutrino-oscillation experiments.
- [m] There is some controversy about whether nuclear physics and model dependence complicate the analysis for bound neutrons (from which the best limit comes). The second limit here is from reactor experiments with free neutrons.
- [n] This is the best “electron disappearance” limit. The best limit for the mode $e^- \rightarrow \nu \gamma$ is $> 2.35 \times 10^{25} \text{ yr}$ (CL=68%).
- [o] The D_1^0 - D_2^0 limits are inferred from the D^0 - \bar{D}^0 mixing ratio $\Gamma(K^+ \ell^- \bar{\nu}_\ell \text{ via } \bar{D}^0) / \Gamma(K^- \ell^+ \nu_\ell)$.
- [p] The larger limit (from E791) allows interference between the doubly Cabibbo-suppressed and mixing amplitudes; the smaller limit (from E691) doesn't. See the papers for details.
- [q] See the K_L^0 Particle Listings for the energy limits used in this measurement.

TABLE OF THE ISOTOPES

Norman E. Holden

This table presents an evaluated set of values for the experimental quantities that characterize the decay of radioactive nuclides. A list of the major references used in this evaluation is given below. When uncertainties are not listed, they are assumed to be five or less in the last digit quoted. If they exceed five in the last digit, the value is prefaced by an approximate sign. For quasi-stable nu-

clides, the measured width, Γ , of the resonance is given. To estimate the approximate half-life, the Heisenberg relationship may be used, the half-life = 4.56×10^{-22} seconds / $\Gamma(\text{MeV})$. The effective literature cutoff date for data in this edition of the Table is December, 2005.

Table Layout

Column No.	Column title	Description
1	Isotope or Element	For elements, the atomic number and chemical symbol are listed. For nuclides, the mass number and chemical symbol are listed. Isomers are indicated by the addition of m, m1, or m2.
2	Isotopic Abundance	In atom percent.
3	Atomic Mass or Atomic Weight	Atomic mass relative to $^{12}\text{C} = 12$. Atomic weight of elements is given on the same scale.
4	Half-life/Resonance Width	Half-life in decimal notation. μs = microseconds; ms = milliseconds; s = seconds; m = minutes; h = hours; d = days; and y = years. For quasi-stable nuclides, the measured width at half maximum of the energy resonance is given
5	Decay Mode/Energy	Decay modes are α = alpha particle emission; β^- = negative beta emission; β^+ = positron emission; EC = orbital electron capture; IT = isomeric transition from upper to lower isomeric state; n = neutron emission; sf = spontaneous fission; $\beta\beta$ = double beta decay. Total disintegration energy in MeV units.
6	Particle Energy/Intensity	End point energies of beta transitions and discrete energies of alpha particles in MeV and their intensities in percent.
7	Spin and Parity	Nuclear spin or angular momentum of the nuclides in units of $\hbar/2\pi$; parity is positive or negative.
8	Magnetic Dipole Moment	Magnetic dipole moments in nuclear magneton units.
9	Electric Quadrupole Moment	Electric quadrupole moments in barn units (10^{-24} cm^2).
10	Gamma Ray Energy/Intensity	Gamma ray energies in MeV and intensities in percent. Ann. rad. refers to the 511.006 keV photons emitted in the annihilation of positrons in matter.

NEUTRON SCATTERING AND ABSORPTION PROPERTIES

Norman E. Holden

This table presents an evaluated set of values for experimental quantities that characterize the properties for scattering and absorption of neutrons. The neutron cross section is given for room temperature neutrons, 20.43°C, corresponding to a thermal neutron energy of 0.0253 electron volts (eV) or a neutron velocity of 2200 meters/second. The neutron resonance integral is defined over the energy range from 0.5 eV to 0.1×10^6 eV, or 0.1 MeV.

Bound neutron scattering lengths and neutron cross sections averaged over a Maxwellian spectrum at 30 keV for astrophysical applications are also presented. A list of the major references used is given below. The literature cutoff date is January 2003. Uncertainties are given in parentheses. Parentheses with two or more numbers indicate values to the excited state(s) and to the ground state of the product nucleus.

Table Layout

Column Number	Column Title	Description
1	Isotope/Element	For elements, atomic number and chemical symbol are listed. For nuclides, mass number and chemical symbol are listed. Isomers are indicated by the addition of m, m1, or m2.
2	Isotopic Abundance	in atom percent
3	Half-life	Half-life in decimal notation. μ s = microsecond; ms = millisecond; s = second; m = minute; h = hour; d = day; y = year.
4	Thermal Neutron Cross Sections	Cross sections for neutron capture reactions in units of barns (10^{-24} cm ²) or millibarns (mb). Proton, alpha production and fission reactions are designated by σ_p , σ_α , σ_f , respectively. Separate values are listed for isomeric production.
5	Neutron Resonance Integrals	Resonance integrals for neutron capture reactions in barns (10^{-24} cm ²) or millibarns (mb). Proton, alpha production and fission reactions are designated by R.I. _p , R.I. _{α} , R.I. _f , respectively. Separate values are listed for isomeric production.
6	Neutron Scattering Lengths	Bound coherent scattering lengths for neutron scattering reactions in units of femtometers (fm), which is equal to fermis (10^{-13} cm).
7	Maxwellian Averaged Cross Section	Astrophysical Cross Sections, averaged over a stellar neutron maxwellian spectrum characterized by a thermal energy of 30 keV, expressed in barns (10^{-24} cm ²), millibarns (mb) or microbarns (μ b).

COSMIC RADIATION

A.G. Gregory and R.W. Clay

The Nature of Cosmic Rays

Primary cosmic radiation, in the form of high energy nuclear particles, electrons and photons from outside the solar system and from the Sun, continually bombards our atmosphere. Secondary radiation, resulting from the interaction of the primary cosmic rays with atmospheric gas, is present at sea-level and throughout the atmosphere.

The secondary radiation is collimated by absorption and scattering in the atmosphere and consists of a number of components associated with different particle species. High energy primary particles can produce large numbers of secondary particles forming an extensive air shower. Thus, a number of particles may then be detected simultaneously at sea-level.

Primary particle energies accessible in the vicinity of the earth range from $\sim 10^8$ eV to $\sim 10^{20}$ eV. At the lower energies, the limit is determined by the inability of charged particles to traverse the heliosphere to us through the outward-moving solar wind. The upper energy limit is set by the practicality of building detectors to record particles with the extremely low fluxes found at those energies (J.G. Wilson, 1976; O.C. Allkofer, 1975a).

Primary Cosmic Rays

Primary Particle Energy Spectrum

Figure 1 shows the spectrum of primary particle energies. This includes all particle species. In differential form it is roughly a power law of intensity versus energy with an index of ~ -3 . There appears to be a knee (a steepening) at a little above 10^{15} eV and an ankle (a flattening) above $\sim 10^{18}$ eV. Figure 2 emphasizes the features in the spectrum at the highest energies through multiplying the flux with a strongly rising power law of energy. This figure should be used with caution as errors for the two axes are not now independent.

Data on the high energy cosmic ray spectrum are uncertain largely because of limited event statistics due to the very low flux which might best be measured in particles per square kilometer per century. The highest energy event recorded to 1995 had an energy of 3×10^{20} eV (D.J. Bird et al., 1993).

It is expected that the highest energy cosmic rays will interact with the 2.7 K cosmic microwave background through photoproduction or photodisintegration. These interactions will appreciably reduce the observed flux of cosmic rays with energies above 5×10^{19} eV if they travel further than ~ 150 million light years. This process is known as the Greisen-Zatsepin-Kuz'min (GZK) cut off (P. Sokolsky, 1989).

At energies below $\sim 10^{13}$ eV, solar system magnetic fields and plasma can modulate the primary component and Figure 3 shows the extent of this modulation between solar maximum and minimum (E. Juliusson, 1975; J. Linsley, 1981).

Primary Particle Energy Density

If the above spectrum is corrected for solar effects, the energy density above a particle energy of 10^9 eV outside the solar system is found to be $\sim 5 \times 10^5$ eV m^{-3} . As the threshold energy is increased, the energy density decreases rapidly, being 2×10^4 eV m^{-3} above 10^{12} eV and 10^2 eV m^{-3} above 10^{15} eV. The energy density at lower energies outside the heliosphere is unknown but may be substan-

tially greater if the particle rest mass energy is included together with the kinetic energy (A. W. Wolfendale, 1979).

Primary Particle Isotropy

This is measured as an anisotropy $(I_{\max} - I_{\min})/(I_{\max} + I_{\min}) \times 100\%$, where I , the intensity ($m^{-2}s^{-1}sr^{-1}$), is usually measured with an angular resolution of a few degrees.

The measured anisotropy is small and energy dependent. It is roughly constant in amplitude at between 0.05 and 0.1% (with a phase of 0 to 6 hours in right ascension) for energies between 10^{11} eV and 10^{14} eV and appears to increase at higher energies roughly as $0.4 \times (\text{Energy(eV)}/10^{16})^{0.5}$ up to $\sim 10^{18}$ eV. The latter rise may well be an artifact of the progressively more limited statistics as the flux drops rapidly with energy. It appears possible that a real anisotropy has been observed at the highest energies (above a few times 10^{19} eV) with a directional preference for the supergalactic plane (this plane reflects the directions of galaxies within about 100 million light years) (A.W. Wolfendale, 1979; R.W. Clay, 1987; T. Stanev et al., 1995).

Primary Particle Composition

The composition of low energy cosmic rays is close to universal nuclear abundances except where propagation effects are present. For example, Li, Be, and B which are spallation products, are over-abundant by about six orders of magnitude.

Composition at 10^{11} eV per nucleus

Charge	1	2	(3-5)	(6-8)	(10-14)	(16-24)	(26-28)	≥ 30
% Composition	50	25	1	12	7	4	4	0.1
(10% uncertainty)								

Measurements at higher energies indicate that there is an increase in the relative abundances of nuclei with charge greater than 6 at energies above 50 TeV/nucleus (K. Asakimori et al., 1993) ($1 \text{ TeV} = 10^{12}$ eV).

Cosmic ray composition at low energies is often quoted at a fixed energy per nucleon. When presented in this way, protons constitute roughly 90% of the flux, helium nuclei about 10% and the remainder sum to a total of about 1%.

Certain radioactive isotopic ratios show lifetime effects. The ratio of Be^{10}/B^9 abundances is used to measure an "age" of cosmic rays since Be^{10} is unstable with a half life of about 1.6×10^6 years. A ratio of 0.6 is expected in the absence of Be^{10} decay and a ratio of about 0.2 is found experimentally (E. Juliusson, 1975; P. Meyer, 1981).

At higher energies, composition determinations are indirect and are rather contradictory and controversial. Experiments aim to differentiate between broad composition models. The measurement technique is based on studies of cosmic ray shower development. A rather direct technique for such studies is to use fluorescence observations of the shower development to determine the atmospheric depth of maximum development of the shower. Such observations suggest a heavy composition (large atomic number) at energies $\sim 10^{17}$ eV which changes with increasing energy to a light composition (perhaps protonic) above $\sim 10^{19}$ eV (T. K. Gaisser et al., 1993).

FIGURE 1. The energy spectrum of cosmic ray particles. This spectrum is of a differential form and can be converted to an integral spectrum by integration over all energies above a required threshold (E). Insofar as the spectrum approximates a power law of index -3 , a simple conversion to the integral at an energy $E/1.8$ is obtained by multiplying the differential flux by the energy and dividing by 0.62 .

FIGURE 2. Energy spectrum at the highest energies. This spectrum (after Yoshida et al., 1995) has the differential spectrum multiplied by energy cubed. It is from a compilation of a number of measurements and indicates the good general agreement at the lower energies and a spread due to inadequate statistics at the highest energies.

FIGURE 3. Energy spectrum of particles at lower energies. (a) Solar minimum proton energy spectrum. (b) Solar maximum proton energy spectrum. (c) Gamma-ray energy spectrum. (d) Local interstellar electron spectrum.

Primary Electrons

Primary electrons constitute about 1% of the cosmic ray beam. The positron to negative electron ratio is about 10% (J. M. Clem et al., 1995).

Antimatter in the Primary Beam

The ratio of antiprotons to protons in the primary cosmic ray beam (at about 400 MeV) is about 10^{-5} . At about 10 GeV the ratio is about 10^{-3} . At the highest measured energies (10 TeV), the upper limit to the ratio is about 20% (S. Orito et al., 1995; M. Amenomori et al., 1995).

Primary Gamma-Rays

The flux of primary gamma-rays is low at high energies. At 1 GeV the ratio of gamma-rays to protons is about 10^{-6} . The arrival directions of these gamma-rays are strongly concentrated in the plane of the Milky Way although there is a diffuse, near isotropic background flux and some point sources have been detected.

Since the absorption cross section for gamma-rays above 100 MeV is approximately 20 mbarn/electron, less than 10% of gamma-rays reach mountain altitudes (A. W. Wolfendale, 1979; P. F. Michelson, 1994).

Sea Level Cosmic Radiation

The sea level cosmic ray dose is 300 millirad-yr⁻¹ and the sea level ionization is 2.2×10^6 ion pairs m⁻³s⁻¹. The sea level flux has a soft component, which can be absorbed in about 100 mm of lead (about 100 g·cm⁻² of absorber) and a more penetrating (largely muon) hard component. The sea level radiation is largely produced in the atmosphere and is a secondary component from interactions of the primary particles. The steep primary energy spectrum means that most secondaries at sea level are from rather low energy primaries. Thus the secondary flux is dependent on the solar cycle and the geomagnetic latitude of the observer.

Absolute Flux of the Hard Component

Vertical Integral Intensity $I(0) \sim 100 \text{ m}^{-2}\text{s}^{-1}\text{sr}^{-1}$

Angular dependence $I(\theta) \sim I(0) \cos^2(\theta)$

Integrated Intensity $\sim 200 \text{ m}^{-2}\text{s}^{-1}$

(O.C. Allkofer, 1975b).

Flux of the Soft Component

In free air, the soft component comprises about one third of the total cosmic ray flux.

Latitude Effect

The geomagnetic field influences the trajectories of lower energy cosmic rays approaching the Earth. As a result, the background flux is reduced by about 7% at the geomagnetic equator. The effect decreases towards the poles and is negligible at latitudes above about 40°.

Flux of Protons

The proton component is strongly attenuated by the atmosphere with an attenuation length (reduction by a factor of e) of about 120 g·cm⁻². It constitutes about 1% of the total vertical sea level flux.

Absorption

The soft component is absorbed in about 100 g·cm⁻² of matter. The hard component is absorbed much more slowly:

Absorption in lead, 6% per 100 g·cm⁻²

Absorption in rock, 8.5% per 100 g·cm⁻²

Absorption in water, 10% per 100 g·cm⁻²

(Absorption for depths less than 100 g·pd cm⁻² is given by K. Greisen, 1943.)

Altitude Dependence

The cosmic ray background in the atmosphere has a maximum intensity of about 15 times that at sea level at a depth of about 150 g·cm⁻² (15 km altitude). At maximum intensity, the soft and hard components contribute roughly equally but the hard component is then attenuated more slowly (S. Hayakawa, 1969).

Cosmic Ray Showers

High energy cosmic rays produce particle cascades in the atmosphere which can be detected at sea level provided that their energy exceeds about 100 GeV (such low energy cascades may be detected by using the most sensitive atmospheric Cerenkov detectors). The primary particle progressively loses energy which is transferred through the production of successive generations of secondary particles to a cascade of hadrons, an electromagnetic shower component (both positively and negatively charged electrons and gamma-rays) and muons. The secondary particles are relativistic and all travel effectively at the speed of light. As a result, they reach sea level at approximately the same time but, due to Coulomb scattering (for the electrons) and production angles (for the pions producing the muons), are spread laterally into a disk-like shower front with a characteristic lateral width of several tens of meters and thickness (near the central shower core) of 2 to 3 m. The number of particles at sea level is roughly proportional to the primary particle energy:

Number of particles at sea level $\sim 10^{-10} \times \text{energy (eV)}$.

At altitudes below a few kilometers, the number of particles in a shower attenuates with an *attenuation length* of about 200 g·cm⁻².

i.e., particle number = original number $\times \exp(-(\text{depth increase})/200)$

The above applies to an individual shower. The rate of observation of showers of a given size (particle number at the detector) at different depths of absorber attenuates with an *absorption length* of about 100 g·cm⁻² (J.G. Wilson, 1976).

Atmospheric Background Light from Cosmic Rays

Cosmic ray particles produce Cerenkov light in the atmosphere and produce fluorescent light through the excitation of atmospheric molecules.

Cerenkov Light

High energy charged particles will cause the emission of Cerenkov light in air if their energies are above about 30 MeV (electrons). This threshold is pressure (and hence altitude) dependent. A typical Cerenkov light pulse (at sea level, 100 m from the central shower core) has a time spread of a few nanoseconds. Over this time, the photon flux between 430 and 530 nm would be $\sim 10^{14} \text{ m}^{-2}\text{s}^{-1}$ for a primary particle energy of 10^{16} eV . For comparison, the night sky background flux is $\sim 6 \times 10^{11} \text{ photons m}^{-2}\text{s}^{-1}\text{sr}^{-1}$ in the same wavelength band (J.V. Jelley, 1967).

Fluorescence Light

Cosmic ray particles in the atmosphere excite atmospheric molecules which then emit fluorescence light. This is weak compared to the highly collimated Cerenkov component when viewed in the direction of the incident cosmic ray particle but is emitted

isotropically. Typical pulse widths are longer than 50 ns and may be up to several microseconds for the total pulse from distant large showers (R.M. Baltrusaitis et al., 1985).

Effects of Cosmic Rays

Cerenkov Effects in Transparent Media

Background cosmic ray particles will produce Cerenkov light in transparent material with a photon yield between wavelengths λ_1 and λ_2

$$\sim (2\pi/137)\sin^2(\theta_c) \int_{\lambda_1}^{\lambda_2} d\lambda / \lambda^2 \text{ photons(unit length)}^{-1}$$

where θ_c (the Cerenkov angle) = $\cos^{-1}(1/\text{refractive index})$.

This background light is known to affect light detectors, e.g., photomultipliers, and can be a major source of background noise (R.W. Clay and A.G. Gregory, 1977).

Effects on Electronic Components

If background cosmic ray particles pass through electronic components, they may deposit sufficient energy to affect the state of, e.g., a transistor flip-flop. This effect may be significant where reliability is of great importance or the background flux is high. For instance, it has been estimated that, in communication satellite operation, an error rate of about 2×10^{-3} per transistor per year may be found. Permanent damage may also result. A significant error rate may be found even at sea level in large electronic memories. This error rate is dependent on the sensitivity of the component devices to the deposition of electrons in their sensitive volumes (J.F. Ziegler, 1981).

Biophysical Significance

When cosmic rays interact with living tissue, they produce radiation damage. The amount of the damage depends on the total dose of radiation. At sea level, this dose is small compared with doses from other sources but both the quantity and quality of the radiation change rapidly with altitude. Approximate dose rates under various conditions are:

Dose rates (mrem.yr⁻¹)
 Sea level cosmic rays, 30
 Cosmic rays at 10 km (subsonic jets), 2000
 Cosmic rays at 18 km (supersonic transports), 10,000
 (c.f., mean total sea level dose, 300)

Astronauts would be subject to radiation from galactic (0.05 rads per day) and solar (a few hundred rads per solar flare) cosmic rays as well as large fluxes of low energy radiation when passing through the Van Allen belts (about 0.3 rads per traverse).

Both astronauts and SST travellers would be subject to a small flux of low energy heavy nuclei stopping in the body. Such particles are capable of destroying cell nuclei and could be particularly harmful in the early stages of the development of an embryo. The rates of heavy nuclei stopping in tissue in supersonic transports and spacecraft are approximately as follows:

Stopping nuclei ((cm³ tissue)⁻¹ hr⁻¹)
 Supersonic transport (16 km), 0.0005
 Supersonic transport (20 km), 0.005
 Spacecraft, 0.15
 (O. C. Allkofer, 1975a; O. C. Allkofer et al., 1974).

Carbon Dating

Radiocarbon is produced in the atmosphere due to the action of cosmic ray slow neutrons. Solar cycle modulation of the very low energy cosmic rays causes an anticorrelation of the atmospheric ¹⁴C activity with sunspot number with a mean amplitude of about 0.5%. In the long term, modulation of cosmic rays by a varying magnetic field may be important (A.A. Burchuladze et al., 1979).

Practical Uses of Cosmic Rays

There are few direct practical uses of cosmic rays. Their attenuation in water and snow have, however, enabled automatic monitors of water and snow depth to be constructed. A search for hidden cavities in pyramids has been carried out using a muon "telescope".

Other Effects

Stellar X-rays have been observed to affect the transmission times of radio signals between distant stations by altering the depth of the ionospheric reflecting layer. It has also been suggested that variations in ionization of the atmosphere due to solar modulation may have observable effects on climatic conditions.

TECHNIQUES FOR MATERIALS CHARACTERIZATION

Experimental Techniques Used to Determine the Composition, Structure, and Energy States of Solids and Liquids

H.P.R. Frederikse

The many experimental methods, originally designed to study the chemical and physical behavior of solids and liquids, have grown into a new field known as Materials Characterization (or Materials Analysis). During the past 30 years a host of techniques aimed at the study of surfaces and thin films has been added to the many tools for the analysis of bulk samples. The field has benefited particularly from the development of computers and micro-processors, which have vastly increased the speed and accuracy of the measuring devices and the recording of their output. Materials characterization was and is a very important tool in the search for new physical and chemical phenomena. It plays an essential role in new applications of solids and liquids in industry, communications, and medicine. Many of its techniques are used in quality control, in safety regulations, and in the fight against pollution.

In most Materials Characterization experiments the sample is subjected to some kind of radiation: electromagnetic, acoustic, thermal, or particles (electrons, ions, neutrons, etc.). The surface

analysis techniques usually require a high vacuum. As a result of interactions between the solid (or liquid) and the incoming radiation a beam of a similar (or a different) nature will emerge from the sample. Measurement of the physical and/or chemical attributes of this emerging radiation will yield qualitative, and often quantitative, information about the composition and the properties of the material being probed.

The modern tendency of describing practically everything in this world by a combination of a few letters (acronyms) has also penetrated the field of Materials Characterization. The table below gives the meaning of the acronym for every technique listed, the form and size of the required sample (bulk, surface, film, liquid, powder, etc.), the nature of the incoming and of the emerging radiation, the depth and the lateral spatial resolution that can be probed, and the information obtained from the experiment. The last column lists one or two major references to the technique described.

14.	(μ)-RS (Micro-) Raman Spectroscopy	Solid, liquid (1 μ m–1 cm)	Laser beam, e.g., Ar-line, YAG-line	Raman spectra	0.5 μ m	0.5 μ m	Molecular and crystal vibrations	12,14,17

	Technique	Sample	In	Out	Depth	Lateral resolution	Information obtained	Ref.
15.	CARS Coherent Anti-Stokes Raman Spectroscopy	Solid, liquid (50 μm –3 cm)	Pump beam (ω_p)+ probe beam (ω_s)	Anti-Stokes spectrum	–	–	High resolution Raman spectra	14
16.	Ellipsometry	Transparent films, crystals, adsorbed layers	Polarized light	Change in polarization	0.05 nm–5 μm	25 μm (or sample thickness)	Refractive index and absorption	18,19
17.	UPS Ultraviolet Photo-electron Spectroscopy	Surfaces, adsorbed layers	u.v. light, 10–100 eV; 200 eV (synchrotron)	Electrons	0.2–10 nm	0.1–10 nm	Energies of electronic states of surfaces and free molecules	20,21
18.	PSD Photon Stimulated Desorption	Surfaces with adsorbed species	Far u.v. light $E > 10$ eV	Ions – analyzed with mass spectrometer	0.1–2 nm	–	Structure and desorption kinetics of adsorbed atoms and molecules	22
X-Rays								
19.	XRD X-Ray Diffraction	Single crystals, powders, films	X-rays: $\lambda = 0.05$ –0.2 nm (6–17 keV)	Diffacted X-ray beam	1–1000 μm	0.1–10 mm	Identification of crystallographic structures; all elements (low Z difficult)	23,24
20.	XRF/EDS X-Ray Fluorescence/Energy Dispersive Spectroscopy	Thin films, single layer	Prim. X-ray beam $\lambda = 0.02$ –0.1 nm 12–80 keV	Fluorescent X-rays	1–100 μm	10 mm	Elemental analysis; all elements except H, He, Li – (EDS also used in XRD, SEM, TEM and EPMA)	25,26
21.	EXAFS Extended X-Ray Absorption Fine Structure	Films, foils	High intensity X-rays (synchrotron)	Spectrum near absorption edge	nm– μm	–	Local atomic structure: order/disorder in vicinity of absorbing atom	27
22.	XPS/ESCA X-Ray Photo-electron Spectroscopy/ Electron Spect. for Chemical Analysis	Surfaces, thin films (≈ 20 atomic layers)	Soft X-rays (1–20 keV)	Core electrons; valence electrons	0.5–10 nm	5 nm–50 μm	(Quantitative) identification of all elements in surface layer or film	28,29
Electrons								
23.	CL Cathode Luminescence	Insulators, semiconductors	Electrons 5–50 keV	Photons 0.1–5 eV	1 nm–2 μm	1 or 2 μm	Energy levels of impurities and point defects	30
24.	APS Appearance Potential Spectroscopy	Surface (≈ 20 atomic layers)	Electrons (energy scan) 50–2000 eV	X-rays to pinpoint electron energy threshold	–	–	Identification of surface species	21, see also C
25.	AES Auger Electron Spectroscopy	Thin films, surfaces	Electrons 3–10 keV	Auger electrons 20–2000 eV	0.3–3 nm	≈ 30 nm	Elemental composition of surface (except H, He); detection limit 0.1–1%	28,29
26.	EELS Electron Energy Loss Spectroscopy	Very thin samples (<200 nm)	Electrons (100–400 keV)	(Retarded) electrons; minus 1–1000 eV	<200 nm	1–100 nm	Local elemental concentration; electronic structure, chem. bonding; interatomic distances	31
27.	EXELFS Extended Electron Energy Loss Fine Structure	Thin films	Electrons (100–400 keV)	Electrons energies 0–30 eV above edge	<200 nm	1–100 nm	Density of states of valence electrons (above Fermi level)	27,32
28.	ESD Electron Stimulated Desorption	Adsorbed species	Electrons $E > 10$ eV	Ions – analyzed with mass spectrometer	–	–	Structure and desorption properties of adsorbed atoms and molecules	22
29.	ESDIAD ESD-Ion Angular Distribution	(See ESD)	(See ESD)	Directional dependence of emitted ions	–	–	Geometries of adsorbed species (atoms or molecules)	22
30.	EPMA Electron Probe (X-Ray) Micro Analysis	Solid conductors and insulators <1 cm thick	Electrons 5–30 keV	Characteristic X-ray 0.1–15 keV	100 nm–5 μm	1 μm	Elemental analysis, $Z \leq 4$, major, minor and trace amounts	33,34
31.	LEED Low Energy Electron Diffraction	Surface	Mono-energetic electron beam 10–1000 eV	Diffacted electrons	0.4–2 nm	<5 μm	Crystallographic structure of surface; resolution: 0.01 nm	35
32.	RHEED Reflection High Energy Electron Diffraction	Surface	Electron beam at grazing angle 5–50 keV	Reflected electrons	0.2–10 nm	<5 μm	Surface symmetry	36,37
33.	SEM Scanning Electron Microscopy	Bulk, films (conducting)	High energy electrons usually ≈ 30 keV	Secondary and backscattered electrons	1 nm–5 μm	1–20 nm	Surface image, defect structure; resolution 5–15 nm; magnification 300,000 \times	33,34
34.	(S)TEM (Scanning) Transmission Electron Microscopy	Thin specimen – <200 nm	High energy electrons typically 300 keV	Transmitted and diffracted electrons	(Sample thickness)	2–20 nm	(Defect) structure of cryst. solids; microchemistry; high resol.: 0.2 nm	33
35.	FEM Field Emission Microscopy	Metals, alloys (sharp point)	–	Electron emission (with appl. electric field – 50 kV)	≈ 0.5 nm	10–100 nm	Surface image, crystallographic structure	34
36.	STM Scanning Tunneling Microscopy	Polished or cleaved surface (conducting)	Tunneling current controls distance between sample and very sharp tip		1–5 nm	2–10 nm	Atomic-scale relief map of surface; resolution: vert. 0.002 nm, hor. 0.2 nm	39
37.	SPM Scanned Probe Microscopy	Very flat surface	Any field: e.g. mechan. vibration recorded with laser probe; same with magnetic, electric or thermal field		1–100 nm	1–100 nm	Surface-magnetic field, surface-thermal conductivity, etc.	39a
38.	AFM Atomic Force Microscopy	Very flat surface	Similar to STM; force measured with cantilever spring		0.5–5 nm	0.2–130 nm	Surface topography with atomic resolution; interatomic force	40

	Technique	Sample	In	Out	Depth	Lateral resolution	Information obtained	Ref.
Ions and Neutrons								
39.	ISS (or LEIS) Ion Scattering Spectroscopy (Low Energy Ion Scattering)	Surface	Ion beam He ⁺ or Ne ⁺ <3 keV	Sputtered ions (energy analysis)	0.1–0.5 nm	1–100 μm	Elemental analysis (better for low Z) detection limits: 0.01–1%	41
40.	FIM Field Ion Microscopy	Surface: metals, alloys; very sharp tip	(He gas above sample)	He ions + high electric field produce image	≈0.1 nm	0.1–2 nm	Atomic structure of surface	34,42
41.	RBS Rutherford Back Scattering	Solids, thin films	Mono-energetic ions (H ⁺ or He ⁺) 0.5–3 MeV	Backscattered ions	10 nm–1 μm	1 mm	Element identification (Li to U) detection limit: 0.01–1%	46
42.	NRA Nuclear Reaction Analysis	Solids, thin films	Mono-energetic ions (Li, Be, B, etc.) 200 keV–6 MeV	Protons, deuterons ³ He, α-particles, γ-rays	0.1–5 μm	10 μm–10 mm	Element identification (all) detection limit: 10 ⁻¹² –10 ⁻²	47
43.	PIXE Particle Induced X-ray Emission	Thin films, surface layers	High energy ions (H ⁺ or He ⁺)	Characteristic X-rays	<10 μm	1 μm–2 mm	Trace impurities: Z>3 detection limit: 0.1–100 ppm (depending on sample thickness)	48
44.	INS Ion Neutralization Spectroscopy	Surface	He-ions (≈5 eV)	Electrons	–	–	Energies of valence electrons	49
45.	NAA Neutron Activation Analysis	Bulk, >0.5 g	Thermal neutrons	Characteristic γ-rays, (≈1 MeV)	Bulk	–	Trace concentrations (of isotopes) of elements: trans. metals, Pt-group; detection limit: 10 ⁸ –10 ¹⁴ atoms/cm ³	43
46.	N(P)D Neutron (Powder) Diffraction	Crystalline solids	Thermal neutrons E ≈0.0025 eV	Diffacted neutrons	Bulk	–	Crystallographic structure; porosity, particle size	44
47.	SANS Small Angle Neutron Scattering	Inhomogeneous solids; powders; porous samples	Thermal neutrons 2 θ = 10 ⁻² –10 ⁻⁴	Scattered neutrons	1–25 mm	–	Average size of inhomogeneities; range: 1 nm–1 mm	45
Acoustic								
48.	SLAM Scanning Laser Acoustic Microscopy	Bulk, film	Acoustic wave produced by laser 1 MHz–1 GHz	Reflected acoustic wave	μm–cm	0.1–20 mm	Defect structure; thickness measurement	50
Thermal								
49.	DTA Differential Thermal Analysis	Specimen and reference sample	Uniform heating	Temperature difference	Bulk	–	Phase transitions, crystallization	51
50.	DSC Differential Scanning Calorimetry	Specimen and ref. sample	Controlled heating	Measure heat required for equal temperature	Bulk	–	Phase transitions, crystallization; activation energies	51
51.	TGA Thermo Gravimetric Analysis	Bulk, 1–100 g	Controlled heating	Weight as function of temperature (and time)	Bulk	–	Decomposition, non-stoichiometry, kinetics of reaction	52
Resonance								
52.	EPR (ESR) Electron Paramagnetic (Spin) Resonance	Paramagnetic solids or liquids	Microwave radiation in magnetic field 3–300 GHz; 1–100 kG	Microwave absorption (at resonance)	Bulk	–	Local environment of paramagnetic ion; concentration of paramagnetic, species; detection limit: 10 ¹¹ spins/cm ³	53,54
53.	ECR Electron Cyclotron Resonance	Semiconductors, metals; free electrons (low temperature)	Microwave radiation in magnetic field 10–30 GHz; 5–10 kG	Microwave absorption (at resonance)	Bulk	–	Electronic energy bands, effective masses	55
54.	Mössbauer Effect	Source and absorber	Mono-energetic γ-rays: 5–100 keV	Mössbauer spectrum (Doppler shifted (lines)	50 m	1 cm	Interaction between nucleus and its environment (local electric, magnetic fields; bonds; valency; diffusion, etc.)	56
55.	NMR (MRI) Nuclear Magnetic Resonance (Magnetic Resonance Imaging)	Solids, liquids	R.F. radiation + magnetic field; e.g. for protons: 60 MHz, 14 kG	R.F. absorption	<1 cm	1 cm	Quant. analysis; local magnetic environment; diffusion; imaging	58
56.	ENDOR Electron Nuclear Double Resonance	Solids, liquids	R.F. + microwave radiation in magn. field.	Microwave absorption	–	–	Hyperfine interaction → local atomic structure	54
57.	NQR Nuclear Quadrupole Resonance	Solids	R.F. radiation 0.5–1000 MHz	R.F. absorption	–	–	Asymmetry of the charge distribution at the nucleus	55,59
Other								
58.	BET Brunauer-Emmett-Teller	(Large) surface area 1–20 m ² /g	Adsorbed gas (e.g., N ₂ at low temp.) as function of pressure (monolayer coverage)		–	–	Surface area measurement	60

SYMMETRY OF CRYSTALS

L. I. Berger

The ability of a body to coincide with itself in its different positions regarding a coordinate system is called its symmetry. This property reveals itself in iteration of the parts of the body in space. The iteration may be done by reflection in mirror planes, rotation about certain axes, inversions and translations. These actions are called the symmetry operations. The planes, axes, points, etc., are known as symmetry elements. Essentially, mirror reflection is the only truly primitive symmetry operation. All other operations may be done by a sequence of reflections in certain mirror planes. Hence, the mirror plane is the only true basic symmetry element. But for clarity, it is convenient to use the other symmetry operations, and accordingly, the other aforementioned symmetry elements. The symmetry elements and operations are presented in Table 1.

The entire set of symmetry elements of a body is called its symmetry class. There are thirty-two symmetry classes that describe all crystals which have ever been noted in mineralogy or been synthesized (more than 150,000). The denominations and symbols of the symmetry classes are presented in Table 2.

There are several known approaches to classification of individual crystals in accordance with their symmetry and crystallochemistry. The particles which form a crystal are distributed in certain points in space. These points are separated by certain distances (translations) equal to each other in any chosen direction in the crystal. Crystal lattice is a diagram that describes the location of particles (individual or groups) in a crystal. The lattice parameters

are three non-coplanar translations that form the crystal lattice. Three basic translations form the unit cell of a crystal. August Bravais (1848) has shown that all possible crystal lattice structures belong to one or another of fourteen lattice types (Bravais lattices). The Bravais lattices, both primitive and non-primitive, are the contents of Table 3.

Among the three-dimensional figures, there is a group of polyhedrons that are called regular, which have all faces of the same shape and all edges of the same size (regular polygons). It has been shown that there are only five regular polyhedrons. Because of their importance in crystallography and solid state physics, a brief description of these polyhedrons is included in Table 4.

The systematic description of crystal structures is presented primarily in the well known *Strukturbericht*. The classification of crystals by the *Strukturbericht* does not reflect their crystal class, the Bravais lattice, but is based on the crystallochemical type. This makes it inconvenient to use the *Strukturbericht* categories for comparison of some individual crystals. Thus, there have been several attempts to provide a more convenient classification of crystals. Table 5 presents a compilation of different classifications which allows the reader to correlate the *Strukturbericht* type with the international and Schoenflies point and space groups and with Pearson's symbols, based on the Bravais lattice and chemical composition of the class prototype. The information included in Table 5 has been chosen as an introduction to a more detailed crystallophysical and crystallochemical description of solids.

TABLE 1. Symmetry Operations and Elements

Symmetry operation	Name	Symmetry element		Presentation on the stereographic projection	
		Symbol		Parallel	Perpendicular
		International (Hermann-Mauguin)	Schoenflies		
Reflection in a plane	Plane	m	C_s		
Rotation by angle $\alpha = 360^\circ/n$ about an axis	Axis	$n = 1, 2, 3, 4 \text{ or } 6$	C_n		
		$n = 2$	C_2		
		$n = 3$	C_3		
		$n = 4$	C_4		
		$n = 6$	C_6		
Rotation about an axis and inversion in a symmetry center lying on the axis	Inversion (improper) axis	$\bar{n} = \bar{3}, \bar{4}, \bar{6}$	C_{ni}		
		$\bar{n} = \bar{3}$	C_{3i}		
		$\bar{n} = \bar{4}$	C_{4i}		

TABLE 1. Symmetry Operations and Elements

Symmetry element					
Symbol					
Symmetry operation	Name	International (Hermann-Mauguin)	Schoenflies	Presentation on the stereographic projection	
				Parallel	Perpendicular
		$\bar{n} = \bar{6}$	C_{6i}		
Inversion in a point	Center	$\bar{1}$	C_i		
Parallel translation	Translation vector $\vec{a}, \vec{b}, \vec{c}$				
Reflection in a plane and translation parallel to the plane	Glide-plane	a, b, c, n, d			
Rotation about an axis and translation parallel to the axis	Screw axis	n_m ($m = 1, 2, \dots, n - 1$)			
Rotation about an axis and reflection in a plane perpen- dicular to the axis	Rotatory- reflection axis	\bar{n} $\bar{n} = \bar{1}, \bar{2}, \bar{3}, \bar{4}, \bar{6}$	S_n		

TABLE 2. The Thirty-Two Symmetry Classes

Crystal symbol	Class name ^a													
	Primitive		Central		Planal		Axial		Plane-axial		Inversion primitive		Inversion-planal	
	Int	Sch	Int	Sch	Int	Sch	Int	Sch	Int	Sch	Int	Sch	Int	Sch
Triclinic	1	C_1	$\bar{1}$	C_i										
Monoclinic					m	C_s	2	C_2	2/m	C_{2h}				
Orthorhombic					mm2	C_{2v}	222	D_2	mmm	D_{2h}				
Trigonal	3	C_3	$\bar{3}$	C_{3i}	3m	C_{3v}	32	D_3	$\bar{3}m$	C_{3d}				
Tetragonal	4	C_4	4/m	C_{4h}	4mm	C_{4v}	422	D_4	4/mmm	D_{4h}	$\bar{4}$	S_4	$\bar{4}2m$	D_{2d}
Hexagonal	6	C_6	6/m	C_{6h}	6mm	C_{6v}	622	D_6	6/mmm	D_{6h}	$\bar{6}$	C_{3h}	$\bar{6}m2$	D_{3h}
Cubic	23	T	m3	T_h	$\bar{4}3m$	T_d	432	O	m3m	O_h

^a The first letter denotes the crystal system: triclinic (a), monoclinic (m), orthorhombic (o), tetragonal (t), hexagonal (h) and cubic (c). Trigonal (rhombohedral) system is denoted by combination hR. The second letter of Pearson's symbol denotes lattice type: primitive (P), edge-(base-) centered (C), body-centered (I) or face-centered (F). The following number denotes number of atoms in the crystal unit cell.

^b Standard ASTM E157-82a has the Bravais lattices designations as following: C – primitive cubic; B – body-centered cubic; F – face-centered cubic; T – primitive tetragonal; U – body-centered tetragonal; R – rhombohedral; H – hexagonal; O – primitive orthorhombic; P – body-centered orthorhombic; Q – base-centered orthorhombic; S – face-centered orthorhombic; M – primitive monoclinic; N – centered monoclinic; A – triclinic.

IONIC RADII IN CRYSTALS

Ionic radii are a useful tool for predicting and visualizing crystal structures. This table lists a set of ionic radii R_i in Å units for the most common coordination numbers CN of positive and negative ions. The values are based on experimental crystal structure determinations, supplemented by empirical relationships, and theoretical calculations. The notation sq after the coordination number indicates a square configuration, while py indicates pyramidal.

The advice of Howard T. Evans and Marvin J. Weber in preparing this table is appreciated.

POLARIZABILITIES OF ATOMS AND IONS IN SOLIDS

H. P. R. Frederikse

The polarization of a solid dielectric medium, \mathbf{P} , is defined as the dipole moment per unit volume averaged over the volume of a crystal cell. A component of \mathbf{P} can be expanded as a function of the electric field \mathbf{E} :

$$P_i = \sum_j a_j E_j + \sum_{jk} b_{jk} E_j E_k$$

For relatively small electric fields in isotropic substances $\mathbf{P} = \chi_e \mathbf{E}$, where χ_e is the electric susceptibility. If the medium is made up of N atoms (or ions) per unit volume, the polarization is $\mathbf{P} = N \mathbf{p}_m$ where \mathbf{p}_m is the average dipole moment per atom. The polarizability α can be defined as $\mathbf{p}_m = \alpha \mathbf{E}_0$, where \mathbf{E}_0 is the local field at the position of the atom. Using the Lorentz method to calculate the local field one finds:

$$\mathbf{P} = N\alpha(\mathbf{E} + 4\pi\mathbf{P}) = \chi_e \mathbf{E}$$

Together with the definition of the dielectric constant (relative permittivity), $\epsilon = 1 + 4\pi\chi_e$, this leads to:

$$\alpha = \frac{3}{4\pi N} \left(\frac{\epsilon - 1}{\epsilon + 2} \right)$$

This expression is known as the Clausius-Mossotti equation.

The total polarization associated with atoms, ions, or molecules is due to three different sources:

1. Electronic polarization arises because the center of the local electronic charge cloud around the nucleus is displaced under the action of the field: $\mathbf{P}_e = N\alpha_e \mathbf{E}_0$ where α_e is the *electronic polarizability*.

2. Ionic polarization occurs in ionic materials because the electric field displaces cations and anions in opposite directions: $\mathbf{P}_i = N\alpha_i \mathbf{E}_0$, where α_i is the *ionic polarizability*.
3. Orientational polarization can occur in substances composed of molecules that have permanent electric dipoles. The alignment of these dipoles depends on temperature and leads to an *orientational polarizability* per molecule: $\alpha_{or} = p^2/3kT$, where p is the permanent dipole moment per molecule, k is the Boltzmann constant, and T is the temperature.

Because of the different nature of these three polarization processes the response of a dielectric solid to an applied electric field will strongly depend on the frequency of the field. The resonance of the electronic excitation in insulators (dielectrics) takes place in the ultraviolet part of the spectrum; the characteristic frequency of the lattice vibrations is located in the infrared, while the orientation of dipoles requires fields of much lower frequencies (below 10^{10} Hz). This response to electric fields of different frequencies is shown in Figure 1. Values of the electronic polarizabilities for selected atoms and ions are given in Table 1.

 Values are appropriate for cgs units. To convert to SI, use the relation $\alpha(\text{SI})/\text{C m}^2\text{V}^{-1} = 1.11265 \cdot 10^{-16} \alpha(\text{cgs})/\text{cm}^3$

CRYSTAL STRUCTURES AND LATTICE PARAMETERS OF ALLOTROPE OF THE ELEMENTS

H. W. King

The crystal structures of the allotropic forms of the elements are presented in terms of the Pearson symbol, the Strukturbericht designation, and the prototype of the structure. The temperatures of the phase transformations are listed in degrees Celsius and the pressures are in the GPa. A consistent nomenclature is used, whereby all allotropes are labeled by Greek letters. The lattice parameters of the units cells are given in nanometers (nm) and are considered to be accurate to ± 2 in the last reported digit.

This compilation is restricted to changes in crystal structures that occur as a result of a change in temperature or pressure. Low-

temperature structures are included for the diatomic and rare gases, which show many similarities with respect to the metallic elements. The elements identified with an asterisk (*) have polymorphic structures based on different molecular configurations. The crystal data given for these elements refer to the most stable structure at room temperature.

Reprinted with the permission of ASM International from T.B. Massalski, Ed., *Binary Alloy Phase Diagrams*, ASM International, Metals Park, Ohio, 1986; certain data on rare earth elements were provided by K.A. Gschneidner.

LATTICE ENERGIES

H. D. B. Jenkins and H. K. Roobottom

THERMOCHEMICAL CYCLE AND CALCULATED VALUES

Table 1 contains calculated values of the lattice energies (total lattice potential energies), U_{POT} , of crystalline salts, M_aX_b . U_{POT} is expressed in units of kilojoules per mole, kJ mol^{-1} . M and X can be either simple or complex ions. Substances are arranged by chemical class.

Also listed in the table is the lattice energy, $U_{\text{POT}}^{\text{BFHC}}$, obtained from the application of the Born - Fajans - Haber cycle (BFHC) described below, using the "Standard Thermochemical Properties of Chemical Substances" table in Section 5 of this *Handbook*, References 1 through 4, and certain other data which are given in Table 3 below.

The lattice enthalpy, ΔH_L , is given by the cycle:

where (ss) is the standard state of the element concerned.

The lattice enthalpy, ΔH_L , is obtained using the equation:

$$\Delta H_L = a\Delta_f H^\circ(M^{b+}, g) + b\Delta_f H^\circ(X^{a-}, g) - \Delta_f H^\circ(M_aX_b, c)$$

and is further related to the total lattice potential energy, U_{POT} , by the relationship:

$$\Delta H_L = U_{\text{POT}} + \left[a \left(\frac{n_M}{2} - 2 \right) + b \left(\frac{n_X}{2} - 2 \right) \right] RT$$

where n_M and n_X equal 3 for monatomic ions, 5 for linear polyatomic ions and 6 for polyatomic non-linear ions.

METHOD OF ESTIMATION OF VALUES NOT TABULATED

In cases where the lattice energy is not tabulated and we want to furnish an estimate, then the Kapustinskii equation⁵ can be used to obtain a value (in kJ mol^{-1}):

$$U_{\text{POT}} = \frac{121.4z_a z_b \nu}{(r_a + r_b)} \left(1 - \frac{0.0345}{(r_a + r_b)} \right)$$

where z_a and z_b are the moduli of the charges on the ν ions in the lattice and r_a and r_b (in nm) are the thermochemical radii given in Table 2. The r_a for metal ions is taken to be the Goldschmidt⁶ radius.

To cite an example, if we wish to estimate the lattice energy of the salt $[\text{NH}_4^+][\text{HF}_2^-]$ using the above procedure, we see that Table 2 gives the thermochemical radius (r_a) for NH_4^+ to be 0.136 nm and that for HF_2^- (r_b) to be 0.172 nm. The lattice potential energy is then estimated to be 700 kJ mol^{-1} compared with the calculated value of 705 kJ mol^{-1} and the Born - Fajans - Haber cycle value of 658 kJ mol^{-1} .

THE MADELUNG CONSTANT AND CRYSTAL LATTICE ENERGY

If U is the crystal lattice energy and M is the Madelung constant, then^a

$$U = \frac{NMz_iz_j e^2}{r} (1 - 1/n)$$

Substance	Ion type	Crystal form ^b	M
Sodium chloride, NaCl	M ⁺ , X ⁻	FCC	1.74756
Cesium chloride, CsCl	M ⁺ , X ⁻	BCC	1.76267
Calcium chloride, CaCl ₂	M ⁺⁺ , 2X ⁻	Cubic	2.365
Calcium fluoride (fluorite), CaF ₂	M ⁺⁺ , 2X ⁻	Cubic	2.51939
Cadmium chloride, CdCl ₂	M ⁺⁺ , 2X ⁻	Hexagonal	2.244 ^c
Cadmium iodide (α), CdI ₂	M ⁺⁺ , 2X ⁻	Hexagonal	2.355 ^c
Magnesium fluoride, MgF ₂	M ⁺⁺ , 2X ⁻	Tetragonal	2.381 ^c
Cuprous oxide (cuprite), Cu ₂ O	2M ⁺ , X ^{- -}	Cubic	2.22124
Zinc oxide, ZnO	M ⁺⁺ , X ^{- -}	Hexagonal	1.4985 ^c
Sphalerite (zinc blende), ZnS	M ⁺⁺ , X ^{- -}	FCC	1.63806
Wurtzite, ZnS	M ⁺⁺ , X ^{- -}	Hexagonal	1.64132 ^c
Titanium dioxide (anatase), TiO ₂	M ⁴⁺ , 2X ^{- -}	Tetragonal	2.400 ^c
Titanium dioxide (rutile), TiO ₂	M ⁴⁺ , 2X ^{- -}	Tetragonal	2.408 ^c
β-Quartz, SiO ₂	M ⁴⁺ , 2X ^{- -}	Hexagonal	2.2197 ^c
Corundum, Al ₂ O ₃	2M ³⁺ , 3X ^{- -}	Rhombohedral	4.1719

^a N is Avogadro's number, z_i and z_j are the integral charges on the ions (in units of e), and e is the charge on the electron in electrostatic units ($e = 4.803 \times 10^{-10}$ esu). r is the shortest distance between cation-anion pairs in centimeters. Then U is in ergs ($1 \text{ erg} = 10^{-7} \text{ J}$).

^b FCC = face centered cubic; BCC = body centered cubic.

^c For tetragonal and hexagonal crystals the value of M depends on the details of the lattice parameters.

The Born Exponent, n is:

Ion type	n
He, Li ⁺	5
Ne, Na ⁺ , F ⁻	7
Ar, K ⁺ , Cu ⁺ , Cl ⁻	9
Kr, Rb ⁺ , Ag ⁺ , Br ⁻	10
Xe, Cs ⁺ , Au ⁺ , I ⁻	12

For a crystal with a mixed-ion type, an average of the values of n in this table is to be used (6 for LiF, for example).

ELASTIC CONSTANTS OF SINGLE CRYSTALS

H. P. R. Frederikse

This table gives selected values of elastic constants for single crystals. The values believed most reliable were selected from the original literature. The substances are arranged by crystal system and, within each system, alphabetically by name. A reference to the original literature is given for each value; a useful compilation of published values from many sources may be found in Reference 1 below.

Data are given for the single-crystal density and for the elastic constants c_{ij} , in units of 10^{11} N/m², which is equivalent to 10^{12} dyn/cm².

ELECTRICAL RESISTIVITY OF PURE METALS

The first part of this table gives the electrical resistivity, in units of $10^{-8} \Omega \text{ m}$, for 28 common metallic elements as a function of temperature. The data refer to polycrystalline samples. The number of significant figures indicates the accuracy of the values. However, at low temperatures (especially below 50 K) the electrical resistivity is extremely sensitive to sample purity. Thus the low-temperature values refer to samples of specified purity and treatment. The references should be consulted for further information on this point, as well as for values at additional temperatures.

The second part of the table gives resistivity values in the neighborhood of room temperature for other metallic elements that have not been studied over an extended temperature range.

ELECTRICAL RESISTIVITY OF SELECTED ALLOYS

These values were obtained by fitting all available measurements to a theoretical formulation describing the temperature and composition dependence of the electrical resistivity of metals. Some of the values listed here fall in regions of temperature and composition where no actual measurements exist. Details of the procedure may be found in the reference.

Values of the resistivity are given in units of $10^{-8} \Omega \text{ m}$. General comments in the preceding table for pure metals also apply here

^m Uncertainty in resistivity is $\pm 2\%$ up to 300 K and $\pm 4\%$ above 300 K.

PERMITTIVITY (DIELECTRIC CONSTANT) OF INORGANIC SOLIDS

H. P. R. Frederikse

This table lists the permittivity ϵ , frequently called the dielectric constant, of a number of inorganic solids. When the material is not isotropic, the individual components of the permittivity are given. A superscript S indicates a measurement made under constant strain ("clamped" dielectric constant). If the constraint is removed, the measurement yields ϵ^T , the "unclamped" or free dielectric constant.

The temperature of the measurement is given when available; the symbol r.t. indicates a value at nominal room temperature. The

frequency of the measurement is given in the last column (i.r. indicates a measurement in the infrared).

Substances are listed in alphabetical order by chemical formula.

Formula	Name	ϵ_{ijk}	T/K	ν/Hz
Ag_3AsS_3	Silver thioarsenate (Proustite)	$\epsilon_{11}^T = 16.5, \epsilon_{11}^S = 14.5$	r.t.	2×10^7
		$\epsilon_{33}^T = 20.0, \epsilon_{11}^S = 18.0$	r.t.	2×10^7
AgBr	Silver bromide	12.50	r.t.	
AgCN	Silver cyanide	5.6	r.t.	10^6
AgCl	Silver chloride	11.15	r.t.	
AgNO_3	Silver nitrate	9.0	293	5×10^5
$\text{AgNa}(\text{NO}_2)_2$	Silver sodium nitrite	4.5 ± 0.5	r.t.	9.4×10^9
Ag_2O	Silver oxide	8.8	r.t.	
$(\text{AlF})_2\text{SiO}_4$	Aluminum fluosilicate (topaz)	$\epsilon_{11} = 6.62$	297	7×10^3
		$\epsilon_{22} = 6.58$	297	7×10^3
		$\epsilon_{33} = 6.95$	297	7×10^3
		$\epsilon_{11} = \epsilon_{22} = 9.34$	298	$10^2 - 8 \times 10^9$
		$\epsilon_{33} = 11.54$	298	$10^2 - 8 \times 10^9$
Al_2O_3	Aluminum oxide (alumina)	$\epsilon_{11}^T = 6.05$		
AlPO_4	Aluminum phosphate		r.t.	10^3
AlSb	Aluminum antimonide	11.21	300	i.r.
AsF_3	Arsenic trifluoride	5.7	r.t.	
BN	Boron nitride	7.1	r.t.	i.r.
BaCO_3	Barium carbonate	8.53	291	2×10^5
$\text{Ba}(\text{COOH})_2$	Barium formate	$\epsilon_{11} = 7.9$	r.t.	10^3
		$\epsilon_{22} = 5.9$	r.t.	10^3
		$\epsilon_{33} = 7.5$	r.t.	10^3
BaCl_2	Barium chloride	9.81	r.t.	
$\text{BaCl}_2 \cdot 2\text{H}_2\text{O}$	Barium chloride dihydrate	9.00	r.t.	10^3
BaF_2	Barium fluoride	7.32	292	$5 \times 10^2 - 10^{11}$
$\text{Ba}(\text{NO}_3)_2$	Barium nitrate	4.95	292	2×10^5
$\text{Ba}_2\text{NaNb}_5\text{O}_{15}$	Barium sodium niobate ("Bananas")	$\epsilon_{11}^S = 222, \epsilon_{11}^T = 235$	296	10^4
		$\epsilon_{22}^S = 227, \epsilon_{22}^T = 247$	296	
		$\epsilon_{33}^S = 32, \epsilon_{33}^T = 51$	296	
BaO	Barium oxide (baria)	34 ± 1	248, 333	60×10^7
BaO_2	Barium peroxide	10.7	r.t.	2×10^6
BaS	Barium sulfide	19.23	r.t.	7.25×10^6
BaSO_4	Barium sulfate	11.4	288	10^8
BaSnO_3	Barium stannate	18	298	25×10^5
BaTiO_3	Barium titanate	$\epsilon_{11}^T = 3600$	298	10^5
		$\epsilon_{11}^S = 2300$	298	2.5×10^8
		$\epsilon_{33}^T = 150$	298	10^5
		$\epsilon_{33}^S = 80$	298	2.5×10^8
$\text{Ba}_6\text{Ti}_2\text{Nb}_8\text{O}_{30}$	Barium titanium niobate	$\epsilon_{11} = \epsilon_{22} \approx 190$	298	
		$\epsilon_{33} \approx 220$	298	
BaWO_4	Barium tungstate	$\epsilon_{11} = \epsilon_{22} = 35.5 \pm 0.2$	297.5	1.6×10^3
		$\epsilon_{33} = 37.2 \pm 0.2$	297.5	1.6×10^3

Formula	Name	ϵ_{ijk}	T/K	ν/Hz
BaZrO ₃	Barium zirconate	43	r.t.	
Be ₃ Al ₂ Si ₆ O ₁₈	Beryllium aluminum silicate (Beryl)	$\epsilon_{33} = 5.95$	297	7×10^3
		$\epsilon_{11} = \epsilon_{22} = 6.86$	297	7×10^3
BeCO ₃	Beryllium carbonate	9.7	291	2×10^5
BeO	Beryllium oxide (beryllia)	7.35 ± 0.2	293	2×10^6
BiFeO ₃	Bismuth iron oxide	40 ± 3	300	9.4×10^9
		$\epsilon_{11}^S = 38$	r.t.	
Bi ₁₂ GeO ₂₀	Bismuth germanite	16	293	
Bi(GeO ₄) ₃	Bismuth germanate	18.2	r.t.	2×10^6
Bi ₂ O ₃	Bismuth sesquioxide	112	r.t.	10^3
Bi ₄ Ti ₃ O ₁₂	Bismuth titanate			
C	Diamond			
	Type I	5.87 ± 0.19	300	10^3
	Type IIa	5.66 ± 0.04	300	10^3
C ₄ H ₄ O ₆	Tartaric acid	$\epsilon_{11} = \epsilon_{22} = 4.3$	298	
		$\epsilon_{33} = 4.5$	298	
		$\epsilon_{13} = 0.55$	298	
C ₆ H ₁₄ N ₂ O ₆	Ethylene diamine tartrate (EDT)	$\epsilon_{11}^T = 5.0$	293	
		$\epsilon_{22}^T = 8.3$	293	
		$\epsilon_{33}^T = 6.0$	293	
		$\epsilon_{13}^T = 0.7$	293	
C ₆ H ₁₂ O ₆ NaBr	Dextrose sodium bromide	$\epsilon_{11}^T = 4.0$	r.t.	10^3
(CH ₃ NH ₃)Al(SO ₄) ₂ · 2H ₂ O	Methyl ammonium alum (MASD)	19	197	
Ca ₂ B ₆ O ₁₁ · 5H ₂ O	Colemanite	$\epsilon_{11} = 20$	293	10^3
		$\epsilon_{33} = 25$	293	10^3
CaCO ₃	Calcium carbonate	$\epsilon_{11} = 8.67$	r.t.	9.4×10^{10}
		$\epsilon_{22} = 8.69$	r.t.	9.4×10^{10}
		$\epsilon_{33} = 8.31$	r.t.	9.4×10^{10}
CaCeO ₃	Calcium cerate	21	r.t.	
CaF ₂	Calcium fluoride	6.81	300	$5 \times 10^2 - 10^{11}$
CaMoO ₄	Calcium molybdate	$\epsilon_{11} = \epsilon_{22} = 24.0 \pm 0.2$	297.5	<10
		$\epsilon_{33} = 20.0 \pm 0.2$	297.5	<10
Ca(NO ₃) ₂	Calcium nitrate	6.54	292	2×10^5
CaNb ₂ O ₆	Calcium niobate	$\epsilon_{11} = 22.8 \pm 1.9$	r.t.	$(5-500) \times 10^3$
Ca ₂ Nb ₂ O ₇	Calcium pyroniobate	~45	r.t.	5×10^7
CaO	Calcium oxide	11.8 ± 0.3	283	2×10^6
CaS	Calcium sulfide	6.699	r.t.	7.25×10^6
CaSO ₄ · 2H ₂ O	Calcium sulfate dihydrate	$\epsilon_{11} = 5.10$	r.t.	
		$\epsilon_{22} = 5.24$	r.t.	
		$\epsilon_{33} = 10.30$	r.t.	
CaTiO ₃	Calcium titanate	165	r.t.	
CaWO ₄	Calcium tungstate	$\epsilon_{11} = \epsilon_{22} = 11.7 \pm 0.1$	297.5	1.59×10^3
		$\epsilon_{33} = 9.5 \pm 0.2$	297.5	1.59×10^3
Cd ₃ As ₂	Cadmium arsenide	$\epsilon_{33} = 18.5$	4	
CdBr ₂	Cadmium bromide	8.6	293	5×10^5
CdF ₂	Cadmium fluoride	8.33 ± 0.08	300	$10^5 - 10^7$
CdS	Cadmium sulfide	$\epsilon_{11} = \epsilon_{22} = 8.7$	300	i.r.
		$\epsilon_{33} = 9.25$	300	i.r.
		$\epsilon_{11} = \epsilon_{22} = 8.37$	8	i.r.
		$\epsilon_{33} = 9.00$	8	i.r.
		$\epsilon_{11}^T = 8.48$	77	10^4
		$\epsilon_{33}^T = 9.48$	77	10^4
		$\epsilon_{11}^S = 9.02, \epsilon_{11}^T = 9.35$	298	10^4
		$\epsilon_{33}^S = 9.53, \epsilon_{33}^T = 10.33$	298	10^4
CdSe	Cadmium selenide	$\epsilon_{11}^S = 9.53, \epsilon_{11}^T = 9.70$	298	10^4

Formula	Name	ϵ_{ijk}	T/K	ν/Hz
		$\epsilon_{33}^S = 10.2, \epsilon_{33}^T = 10.65$	298	10^4
CdTe	Cadmium telluride	$\epsilon_{11} = \epsilon_{22} = 10.60 \pm 0.15$	297	i.r.
		$\epsilon_{33} = 7.05 \pm 0.05$	297	i.r.
$\text{Cd}_2\text{Nb}_2\text{O}_7$	Cadmium pyroniobate	500–580	293	10^3
CeO_2	Cerium oxide	7.0	r.t.	2×10^6
CoNb_2O_6	Cobalt niobate	$\epsilon_{11} = 18.4 \pm 1.1$	r.t.	$(5-500) \times 10^3$
		$\epsilon_{22} = 21.4 \pm 1.1$	r.t.	$(5-500) \times 10^3$
		$\epsilon_{33} = 33.0 \pm 0.7$	r.t.	$(5-500) \times 10^3$
CoO	Cobalt oxide	12.9	298	$10^2 - 10^{10}$
Cr_2O_3	Chromic sesquioxide	$\epsilon_{11} = \epsilon_{22} = 13.3$	298.5	10^3
		$\epsilon_{33} = 11.9$	298.5	10^3
		8	315 (T_N)	6×10^{10}
$\text{CsAl}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$	Cesium alum	5.0	r.t.	$20-20 \times 10^3$
CsBr	Cesium bromide	6.38	298	1.6×10^3
Cs_2CO_3	Cesium carbonate	6.53	291	2×10^5
CsCl	Cesium chloride	7.2	298	
CsH_2AsO_4	Cesium dihydrogen arsenate (CDA)	4.8	273	9.5×10^9
CsH_2PO_4	Cesium dihydrogen phosphate (CDP)	6.15	285	9.5×10^9
$\text{CsH}_3(\text{SeO}_3)_2$	Cesium trihydrogen selenite	$\epsilon_{11} = 80$	273	10^5
		$\epsilon_{22} = 63$	273	10^5
		$\epsilon_{33} = 12$	273	10^5
CsI	Cesium iodide	6.31	298	1.6×10^3
CsNO_3	Cesium nitrate	$\epsilon_{11} = \epsilon_{22} = 9.4$	r.t.	5×10^5
		$\epsilon_{33} = 8.3$	r.t.	5×10^5
CsPbCl_3	Cesium lead chloride	14.37	300	10^5-10^6
CuBr	Cuprous bromide	8.0	293	5×10^5
CuCl	Cuprous chloride	9.8 ± 0.5	r.t.	10^3
CuO	Cupric oxide	18.1	r.t.	2×10^6
Cu_2O	Cuprous oxide (Cuprite)	7.60 ± 0.06	r.t.	10^5
$\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$	Cupric sulfate pentahydrate	6.60	r.t.	
EuF_2	Europium fluoride	7.7 ± 0.2	298	$(1-300) \times 10^3$
$\text{Eu}_2(\text{MoO}_4)_3$	Europium molybdate	9.5	298	
EuS	Europium sulfide	13.10 ± 0.04	80	$5 \times 10^2-10^5$
FeO	Ferrous oxide	14.2	r.t.	2×10^6
Fe_2O_3	Ferric sesquioxide	4.5	r.t.	10^5-10^7
$\text{Fe}_2\text{O}_3\text{-}\alpha$	Ferric sesquioxide (hematite)	12		6×10^{10}
Fe_3O_4	Ferrosoferric oxide (magnetite)	20	r.t.	10^5-10^7
GaAs	Gallium arsenide	13.13	300	
		12.90	4	i.r.
GaP	Gallium phosphide	11.1	r.t.	
		10.75 ± 0.1	1.6	i.r.
GaSb	Gallium antimonide	15.69	r.t.	
		15.7	4	i.r.
$\text{Gd}_2(\text{MoO}_4)_3$	Gadolinium molybdate	$\epsilon^T = 10$	298	
		$\epsilon^S = 9.5$	298	10^3
Ge	Germanium	16.0 ± 0.3	4	9.2×10^9
		15.8 ± 0.2	r.t.	$500-3 \times 10^{10}$
GeO_2	Germanium dioxide	$\epsilon_{11} = \epsilon_{22} = 7.44$	r.t.	i.r.
HIO_3	Iodic acid	$\epsilon_{11} = 7.5$	r.t.	10^3
		$\epsilon_{22} = 12.4$	r.t.	10^3
		$\epsilon_{33} = 8.1$	r.t.	10^3
$\text{HNH}_4(\text{ClCH}_2\text{COO})_2$	Hydrogen ammonium dichloroacetate	$\epsilon_{[102]} = 5.9$	r.t.	10^5
H_2O	Ice I (P = 0 kbar)	99	243	
	Ice III (P = 3 kbar)	117	243	
	Ice V (P = 5 kbar)	114	243	
	Ice VI (P = 8 kbar)	193	243	
HgCl	Mercurous chloride (Calumel)	$\epsilon_{11} = \epsilon_{22} = 14.0$	r.t.	10^{12}
HgCl_2	Mercuric chloride	6.5	r.t.	10^{12}
HgS	Mercurous sulfide (Cinnabar)	$\epsilon_{11} = \epsilon_{22} = 18.0$	r.t.	i.r.
		$\epsilon_{33} = 32.5$	r.t.	i.r.

Formula	Name	ϵ_{ijk}	T/K	ν/Hz
HgSe	Mercurous selenide	25.6	r.t.	$10^4\text{--}10^6$
I ₂	Iodine	$\epsilon_{11} = 6$	r.t.	$5 \times 10^4\text{--}10^7$
		$\epsilon_{22} = 3$	r.t.	$5 \times 10^4\text{--}10^7$
		$\epsilon_{33} = 40$	r.t.	$5 \times 10^4\text{--}10^7$
InAs	Indium arsenide	14.55 ± 0.3	r.t.	i.r.
		15.15	4	i.r.
InP	Indium phosphide	12.61	r.t.	i.r.
InSb	Indium antimonide	17.88	4	i.r.
KAl(SO ₄) ₂ · 12H ₂ O	Potassium alum	6.5	r.t.	$20\text{--}20 \times 10^3$
KBr	Potassium bromide	4.88	300	
		4.53	4.2	
KBrO ₃	Potassium bromate	7.3	r.t.	2×10^6
KCN	Potassium cyanide	6.15	r.t.	2×10^6
K ₂ CO ₃	Potassium carbonate	4.96	291	2×10^5
K ₂ C ₄ H ₄ O ₆ · 1/2 H ₂ O	Dipotassium tartrate (DKT)	$\epsilon_{11} = 6.44$	r.t.	
		$\epsilon_{22} = 5.80$	r.t.	
		$\epsilon_{33} = 6.49$	r.t.	
		$\epsilon_{13} = 0.005$	r.t.	
KCl	Potassium chloride	4.86 ± 0.02	r.t.	5×10^3
		4.50	4.2	
KClO ₃	Potassium chlorate	5.1	r.t.	2×10^6
KClO ₄	Potassium perchlorate	5.9	r.t.	2×10^6
K ₂ CrO ₄	Potassium chromate	7.3	r.t.	6×10^7
KCr(SO ₄) ₂ · 12H ₂ O	Potassium chrome alum	6.5	100–240	175×10^3
KD ₂ AsO ₄	Potassium dideuterium arsenate (KDDA)	$\epsilon_{11} = 70$	298	
		$\epsilon_{33} = 31$	298	
KD ₂ PO ₄	Potassium dideuterium phosphate (KDDP)	50 ± 2	297	10^3
KF	Potassium fluoride	6.05		2×10^6
KH ₂ AsO ₄	Potassium dihydrogen arsenate (KDA)	$\epsilon_{11} = 60$	298	
		$\epsilon_{33} = 24$	298	
KH ₂ PO ₄	Potassium dihydrogen phosphate (KDP)	46	298	10^3
		$\epsilon_{11} = 42$	r.t.	
		$\epsilon_{33} = 21$	r.t.	
K ₂ HPO ₄	Dipotassium monohydrogen orthophosphate	9.05	r.t.	2×10^6
KI	Potassium iodide	5.00	r.t.	9.4×10^{10}
KIO ₃	Potassium iodate	170	255	10^5
		10	293	10^5
		$\epsilon_{[101]} \approx 40,70$	r.t.	10^5
		16.85	r.t.	2×10^6
(K,H)Al ₃ (SiO ₃) ₃	Mica (muscovite)	5.4	299	$10^2\text{--}3 \times 10^9$
(K,H)Mg ₃ Al(SiO ₃) ₃	Mica (Canadian)	$\epsilon_{11} = \epsilon_{32} = 6.9$	298	$10^2\text{--}10^4$
		$\epsilon_{33} = 7.3$	298	10^4

PROPERTIES OF SUPERCONDUCTORS

L. I. Berger and B. W. Roberts

The following tables include superconductive properties of selected elements, compounds, and alloys. Individual tables are given for thin films, elements at high pressures, superconductors with high critical magnetic fields, and high critical temperature superconductors.

The historically first observed and most distinctive property of a superconductive body is the near total loss of resistance at a critical temperature (T_c) that is characteristic of each material. Figure 1(a) below illustrates schematically two types of possible transitions. The sharp vertical discontinuity in resistance is indica-

tive of that found for a single crystal of a very pure element or one of a few well annealed alloy compositions. The broad transition, illustrated by broken lines, suggests the transition shape seen for materials that are not homogeneous and contain unusual strain distributions. Careful testing of the resistivity limit for superconductors shows that it is less than 4×10^{-23} ohm cm, while the lowest resistivity observed in metals is of the order of 10^{-13} ohm cm. If one compares the resistivity of a superconductive body to that of copper at room temperature, the superconductive body is at least 10^{17} times less resistive.

FIGURE 1. Physical properties of superconductors. (a) Resistivity vs. temperature for a pure and perfect lattice (solid line); impure and/or imperfect lattice (broken line). (b) Magnetic-field temperature dependence for Type-I or "soft" superconductors. (c) Schematic magnetization curve for "hard" or Type-II superconductors.

The temperature interval ΔT_c , over which the transition between the normal and superconductive states takes place, may be of the order of as little as 2×10^{-5} K or several K in width, depending on the material state. The narrow transition width was attained in 99.9999% pure gallium single crystals.

A Type-I superconductor below T_c , as exemplified by a pure metal, exhibits perfect diamagnetism and excludes a magnetic field up to some critical field H_c , whereupon it reverts to the normal state as shown in the H - T diagram of Figure 1(b).

The magnetization of a typical high-field superconductor is shown in Figure 1(c). The discovery of the large current-carrying capability of Nb_3Sn and other similar alloys has led to an extensive study of the physical properties of these alloys. In brief, a high-field superconductor, or Type-II superconductor, passes from the perfect diamagnetic state at low magnetic fields to a mixed state and finally to a sheathed state before attaining the normal resistive state of the metal. The magnetic field values separating the four stages are given as H_{c1} , H_{c2} , and H_{c3} . The superconductive state below H_{c1} is perfectly diamagnetic, identical to the state of most pure metals of the "soft" or Type-I superconductor. Between H_{c1} and H_{c2} a "mixed superconductive state" is found in which fluxons (a minimal unit of magnetic flux) create lines of normal flux in a superconductive matrix. The volume of the normal state is proportional to $-4\pi M$ in the "mixed state" region. Thus at H_{c2} the fluxon density has become so great as to drive the interior volume of the superconductive body completely normal. Between H_{c2} and H_{c3} the superconductor has a sheath of current-carrying superconductive material at the body surface, and above H_{c3} the normal state exists. With several types of careful measurement, it is possible to determine H_{c1} , H_{c2} , and H_{c3} . Table 6 contains some of the available data on high-field superconductive materials.

High-field superconductive phenomena are also related to specimen dimension and configuration. For example, the Type-I superconductor, Hg, has entirely different magnetization behavior in high magnetic fields when contained in the very fine sets of filamentary tunnels found in an unprocessed Vycor glass. The great majority of superconductive materials are Type-II. The elements in very pure form and a very few precisely stoichiometric and well annealed compounds are Type I with the possible exceptions of vanadium and niobium.

Metallurgical Aspects. The sensitivity of superconductive properties to the material state is most pronounced and has been used in a reverse sense to study and specify the detailed state of alloys. The mechanical state, the homogeneity, and the presence of impurity atoms and other electron-scattering centers are all capable of controlling the critical temperature and the current-carrying capabilities in high-magnetic fields. Well annealed specimens tend to show sharper transitions than those that are strained or inhomogeneous. This sensitivity to mechanical state underlines a general problem in the tabulation of properties for superconductive materials. The occasional divergent values of the critical temperature and of the critical fields quoted for a Type-II superconductor may lie in the variation in sample preparation. Critical temperatures of materials studied early in the history of superconductivity must be evaluated in light of the probable metallurgical state of the material, as well as the availability of less pure starting elements. It has been noted that recent work has given extended consideration to the metallurgical aspects of sample preparation.

Symbols in tables: T_c : Critical temperature; H_0 : Critical magnetic field in the $T = 0$ limit; θ_D : Debye temperature; and γ : Electronic specific heat.

TABLE 4. Superconductive Compounds and Alloys

All compositions are denoted on an atomic basis, i.e., AB, AB₂, or AB₃ for compounds, unless noted. Solid solutions or odd compositions may be denoted as A_xB_{1-x} or A_zB. A series of three or more alloys is indicated as A_xB_{1-x} or by actual indication of the atomic fraction range, such as A_{0-0.6}B_{1-0.4}. The critical temperature of such a series of alloys is denoted by a range of values or possibly the maximum value.

The selection of the critical temperature from a transition in the effective permeability, or the change in resistance, or possibly the incremental changes in frequency observed by certain techniques is not often obvious from the literature. Most authors choose the

mid-point of such curves as the probable critical temperature of the idealized material, while others will choose the highest temperature at which a deviation from the normal state property is observed. In view of the previous discussion concerning the variability of the superconductive properties as a function of purity and other metallurgical aspects, it is recommended that appropriate literature be checked to determine the most probable critical temperature or critical field of a given alloy.

A very limited amount of data on critical fields, H_c , is available for these compounds and alloys; these values are given at the end of the table.

A. Superconductors with $T_c < 10$ K

HIGH TEMPERATURE SUPERCONDUCTORS

C. N. R. Rao and A. K. Raychaudhuri

The following tables give properties of a number of high temperature superconductors. Table 1 lists the crystal structure (space group and lattice constants) and the critical transition temperature T_c for the more important high temperature superconductors so far studied. Table 2 gives energy gap, critical current density, and penetration depth in the superconducting state. Table 3 gives electrical and thermal properties of some of these materials in the normal state. The tables were prepared in November 1992 and updated in November 1994.

ORGANIC SUPERCONDUCTORS

H.P.R. Frederikse

Although the vast majority of organic compounds are insulators, a small number of organic solids show considerable electrical conductivity. Some of these materials appear to be superconductors. The superconducting organics fall primarily into two groups: those containing fulvalenes (pentagonal rings containing sulfur or selenium) and those based on fullerenes, involving the nearly spherical cluster C_{60} .

The transition temperatures T_c of the fulvalene derivatives are shown in Table 1. The abbreviations of the various molecular groups are listed in Table 2 and their chemical structures are depicted in Figure 1. Most of the T_c 's are between 1 and 12 K. Several of the compounds only show superconductivity under pressure.

The fullerenes are A_3C_{60} compounds, where A represents a single or a combination of alkali atoms. The C_{60} cluster is shown in

Figure 2a, while Figure 2b illustrates how the alkali atoms fit into the A_3C_{60} molecule to form the A15 crystallographic structure. Their superconducting transition temperatures range from 8 to 31.3 K (see Table 3).

PROPERTIES OF SEMICONDUCTORS

L.I. Berger

The term *semiconductor* is applied to a material in which electric current is carried by electrons or holes and whose electrical conductivity, when extremely pure, rises exponentially with temperature and may be increased from its low "intrinsic" value by many orders of magnitude by "doping" with electrically active impurities.

Semiconductors are characterized by an energy gap in the allowed energies of electrons in the material which separates the normally filled energy levels of the *valence band* (where "missing" electrons behave like positively charged current carriers "holes") and the *conduction band* (where electrons behave rather like a gas of free negatively charged carriers with an effective mass dependent on the material and the direction of the electrons' motion). This energy gap depends on the nature of the material and varies with direction in anisotropic crystals. It is slightly dependent on temperature and pressure, and this depen-

dence is usually almost linear at normal temperatures and pressures.

Data are presented in five tables. Table 1 lists the main crystallographic and semiconducting properties of a large number of semiconducting materials in three main categories: "Tetrahedral Semiconductors" in which every atom is tetrahedrally coordinated to four nearest neighbor atoms (or atomic sites) as for example in the diamond structure; "Octahedral Semiconductors" in which every atom is octahedrally coordinated to six nearest neighbor atoms—as for example the halite structure; and "Other Semiconductors."

Table 2 gives electrical, magnetic, and optical properties, while Tables 3 and 4 give more details on the semiconducting properties and band structure of the most common semiconductors. Table 5 lists semiconducting minerals with typical resistivity ranges.

Bi ₂ Te ₂	0.13	6			~0.05

TABLE 5. Resistivity of Semiconducting Minerals

Mineral	ρ (ohm · m)	Mineral	ρ (ohm · m)
Diamond (C)	2.7	Pentlandite, (Fe, Ni) ₄ S ₄	1 to 11 ¥ 10 ⁻⁶
Sulfides		Pyrrhotite, Fe ₇ S ₄	2 to 160 ¥ 10 ⁻⁶
Argentite, Ag ₂ S	1.5 to 2.0 ¥ 10 ⁻³	Pyrite, FeS ₂	1.2 to 600 ¥ 10 ⁻³
Bismuthinite, Bi ₂ S ₃	3 to 570	Sphalerite, ZnS	2.7 ¥ 10 ⁻³ to 1.2 ¥ 10 ⁴
Bornite, Fe ₂ S ₃ · <i>n</i> Cu ₂ S	1.6 to 6000 ¥ 10 ⁻⁶	Antimony-sulfur compounds	
Chalcocite, Cu ₂ S	80 to 100 ¥ 10 ⁻⁶	Berthierite, FeSb ₂ S ₄	0.0083 to 2.0
Chalcopyrite, Fe ₂ S ₃ · Cu ₂ S	150 to 9000 ¥ 10 ⁻⁶	Boulangerite, Pb ₅ Sb ₃ S ₁₁	2 ¥ 10 ³ to 4 ¥ 10 ⁴
Covellite, CuS	0.30 to 83 ¥ 10 ⁻⁶	Cylindrite, Pb ₃ Sn ₄ Sb ₂ S ₁₄	2.5 to 60
Galena, PbS	6.8 ¥ 10 ⁻⁶ to 9.0 ¥ 10 ⁻²	Franckeite, Pb ₃ Sn ₃ Sb ₂ S ₁₄	1.2 to 4
Haverite, MnS ₂	10 to 20	Hauchecornite, Ni ₄ (Bi, Sb) ₂ S ₁₄	1 to 83 ¥ 10 ⁻⁶
Marcasite, FeS ₂	1 to 150 ¥ 10 ⁻³	Jamesonite, Pb ₄ FeSb ₆ S ₁₄	0.020 to 0.15
Metacinnabarite, HgS	2 ¥ 10 ⁻⁶ to 1 ¥ 10 ⁻³	Tetrahedrite, Cu ₃ SbS ₃	0.30 to 30,000
Millerite, NiS	2 to 4 ¥ 10 ⁻⁷	Arsenic-sulfur compounds	
Molybdenite, MoS ₂	0.12 to 7.5	Arsenopyrite, FeAsS	20 to 300 ¥ 10 ⁻⁶

Cobaltite, CoAsS	6.5 to 130 $\times 10^{-3}$	Hessite, Ag ₂ Te	4 to 100 $\times 10^{-6}$
Enargite, Cu ₃ AsS ₄	0.2 to 40 $\times 10^{-3}$	Nagyagite, Pb ₆ Au(S,Te) ₁₄	20 to 80 $\times 10^{-6}$
Gersdorffite, NiAsS	1 to 160 $\times 10^{-6}$	Sylvanite, AgAuTe ₄	4 to 20 $\times 10^{-6}$
Glaucodote, (Co, Fe)AsS	5 to 100 $\times 10^{-6}$	Oxides	
Antimonide		Braunite, Mn ₂ O ₃	0.16 to 1.0
Dyscrasite, Ag ₃ Sb	0.12 to 1.2 $\times 10^{-6}$	Cassiterite, SnO ₂	4.5 $\times 10^{-4}$ to 10,000
Arsenides		Cuprite, Cu ₂ O	10 to 50
Allemontite, SbAs ₃	70 to 60,000	Hollandite, (Ba, Na, K) Mn ₈ O ₁₆	2 to 100 $\times 10^{-3}$
Lollingite, FeAs ₂	2 to 270 $\times 10^{-6}$	Ilmenite, FeTiO ₃	0.001 to 4
Nicollite, NiAs	0.1 to 2 $\times 10^{-6}$	Magnetite, Fe ₃ O ₄	52 $\times 10^{-6}$
Skutterudite, CoAs ₃	1 to 400 $\times 10^{-6}$	Manganite, MnO · OH	0.018 to 0.5
Smaltite, CoAs ₂	1 to 12 $\times 10^{-6}$	Melaconite, CuO	6000
Tellurides		Psilomelane, BaMn ₉ O ₁₈ · 2H ₂ O	0.04 to 6000
Altaite, PbTe	20 to 200 $\times 10^{-6}$	Pyrolusite, MnO ₂	0.007 to 30
Calavarite, AuTe ₂	6 to 12 $\times 10^{-6}$	Rutile, TiO ₂	29 to 910
Coloradoite, HgTe	4 to 100 $\times 10^{-6}$	Uraninite, UO ₂	1.5 to 200

DIFFUSION DATA FOR SEMICONDUCTORS

B. L. Sharma

The diffusion coefficient D in many semiconductors may be expressed by an Arrhenius-type relation

$$D = D_0 \exp(-Q/kT)$$

where D_0 is a frequency factor, Q is the activation energy for diffusion, k is the Boltzmann constant, and T is the absolute temperature. This table lists D_0 and Q for various diffusants in common semiconductors.

Abbreviations used in the table are

- AES – Auger Electron Spectroscopy
- DLTS – Deep Level Transient Spectroscopy
- SEM – Scanning Electron Microscopy
- SIMS – Secondary Ion Mass Spectrometry
- $D(c)$ – Concentration Dependent Diffusion Coefficient
- D_{\max} – Maximum Diffusion Coefficient
- (f) – Fast Diffusion Component
- (i) – Interstitial Diffusion Component
- (s) – Slow Diffusion Component
- (||) – Parallel to c Direction
- (\perp) – Perpendicular to c Direction

Semiconductor	Diffusant	Frequency factor, D_0 (cm ² /s)	Activation energy, Q (eV)	Temperature range (°C)	Method of measurement	Ref.
Si	H	6×10^{-1}	1.03	120–1207	Electrical and SIMS	1

PROPERTIES OF MAGNETIC MATERIALS

H. P. R. Frederikse

Glossary of Symbols

Quantity	Symbol	Units	
		SI	emu
Magnetic field	H	A m^{-1}	Oe (oersted)
Magnetic induction	B	T (tesla)	G (gauss)
Magnetization	M	A m^{-1}	emu cm^{-3}
Spontaneous magnetization	M_s	A m^{-1}	emu cm^{-3}
Saturation magnetization	M_0	A m^{-1}	emu cm^{-3}
Magnetic flux	Φ	Wb (weber)	maxwell
Magnetic moment	m, μ	A m^2	erg/G
Coercive field	H_c	A m^{-1}	Oe
Remanence	B_r	T	G
Saturation magnetic polarization	J_s	T	G
Magnetic susceptibility	χ		
Magnetic permeability	μ	H m^{-1} (henry/meter)	
Magnetic permeability of free space	μ_0	H m^{-1}	
Saturation magnetostriction	$\lambda (\Delta l/l)$		
Curie temperature	T_C	K	K
Néel temperature	T_N	K	K

Magnetic moment $\mu = \gamma \hbar J = g \mu_B J$

where

γ = gyromagnetic ratio; J = angular momentum; g = spectroscopic splitting factor (~ 2)

μ_B = bohr magneton = $9.2741 \cdot 10^{-24} \text{ J/T} = 9.2741 \cdot 10^{-21} \text{ erg/G}$

Earth's magnetic field $H = 56 \text{ A m}^{-1} = 0.7 \text{ Oe}$

For iron: $M_0 = 1.7 \cdot 10^6 \text{ A m}^{-1}$; $B_r = 0.8 \cdot 10^6 \text{ A m}^{-1}$

$1 \text{ Oe} = (1000/4\pi) \text{ A m}^{-1}$; $1 \text{ G} = 10^{-4} \text{ T}$; $1 \text{ emu cm}^{-3} = 10^3 \text{ A m}^{-1}$

$1 \text{ maxwell} = 10^{-8} \text{ Wb}$

$\mu_0 = 4\pi \cdot 10^{-7} \text{ H m}^{-1}$

Relation Between Magnetic Induction and Magnetic Field

FIGURE 1. Typical curve representing the dependence of magnetic induction B on magnetic field H for a ferromagnetic material. When H is first applied, B follows curve **a** as the favorably oriented magnetic domains grow. This curve flattens as saturation is approached. When H is then reduced, B follows curve **b**, but retains a finite value (the remanence B_r) at $H = 0$. In order to demagnetize the material, a negative field $-H_c$ (where H_c is called the coercive field or coercivity) must be applied. As H is further decreased and then increased to complete the cycle (curve **c**), a hysteresis loop is obtained. The area within this loop is a measure of the energy loss per cycle for a unit volume of the material.

FIGURE 2. Schematic curve illustrating the B vs. H dependence for hard and soft magnetic materials. Hard materials have a larger remanence and coercive field, and a correspondingly large hysteresis loss.

Magnetic Susceptibility of the Elements

FIGURE 3. Molar susceptibility of the elements at room temperature (cgs units of $10^{-6} \text{ cm}^3/\text{mol}$). Values are not available for $Z = 9, 61$, and $84-89$; Fe, Co, and Ni ($Z = 26-28$) are ferromagnetic. Data taken from the table "Magnetic Susceptibility of the Elements and Inorganic Compounds" in Section 4.

Applications of High-Permeability Materials

Applications

Requirements

Power applications

Distribution and power transformers

Low core losses, high permeability, high saturation magnetic polarization

High-quality motors and generators, stators and armatures, switched-mode power supplies

Instrument transformers

Audiofrequency transformers

Low core losses, high permeability, high magnetic polarization

Pulse transformers

High permeability

Cores for inductor coils

Audiofrequency

Low hysteresis, high permeability

Carrier frequency

Very low hysteresis and eddy current loss

Radiofrequency

High permeability at low fields

Miscellaneous

Relays, switches
Earth leakage circuit }

High permeability, low remanence, low coercivity

Magnetic shielding

Low core loss for AC applications

Applications of High-Permeability Materials

Applications	Requirements
Magnetic recording heads	High initial permeability, low or zero remanence
Magnetic amplifiers Saturable reactors Saturable transformers Transformer cores	Rectangular hysteresis loops, low hysteresis loss
Magnetic shunts for temperature compensation in magnetic circuits	Low Curie temperature, appropriate decrease in permeability with increase in temperature
Electromagnets in indicating instruments, fire detection, quartz watches, electromechanical devices	High permeability, high saturation magnetic polarization
Magnetic yokes in permanent magnet devices, such as lifting and holding magnets, loudspeakers	High permeability, high saturation magnetic polarization

ELECTRON WORK FUNCTION OF THE ELEMENTS

The electron work function Φ is a measure of the minimum energy required to extract an electron from the surface of a solid. It is defined more precisely as the energy difference between the state in which an electron has been removed to a distance from the surface of a single crystal face that is large enough that the image force is negligible but small compared to the distance to any other face (typically about 10^{-4} cm) and the state in which the electron is in the bulk solid. In general, Φ differs for each face of a mono-crystalline sample.

Since Φ is dependent on the cleanliness of the surface, measurements reported in the literature often cover a considerable range. This table contains selected values for the electron work function of the elements which may be regarded as typical values for a reasonably clean surface. The method of measurement is indicated for each value. The following abbreviations appear:

TE – Thermionic emission
PE – Photoelectric effect
FE – Field emission
CPD – Contact potential difference
polycr – Polycrystalline sample
amorp – Amorphous sample

Values in parentheses are only approximate.

SECONDARY ELECTRON EMISSION

The secondary emission yield, or secondary emission ratio, δ , is the average number of secondary electrons emitted from a bombarded material for every incident primary electron. It is a function of the primary electron energy E_p . The maximum yield δ_{\max} corresponds to a primary electron energy $E_{p\max}$ (see figure). The two primary electron energies corresponding to a yield of unity are denoted the first and second crossovers (E_I and E_{II}). An insulat-

ing target, or a conducting target that is electrically floating, will charge positively or negatively depending on the primary electron energy. For $E_I < E_p < E_{II}$, $\delta > 1$ and the surface charges positively provided there is a collector present that is positive with respect to the target. For $E_p < E_I$ or $E_p > E_{II}$, $\delta < 1$, and the surface charges negatively with respect to the potential of the source of primary electrons.

Element	δ_{\max}	$E_{p\max}$ (eV)	E_I (eV)	E_{II} (eV)	Element	δ_{\max}	$E_{p\max}$ (eV)	E_I (eV)	E_{II} (eV)

OPTICAL PROPERTIES OF SELECTED ELEMENTS

J. H. Weaver and H. P. R. Frederikse

These tables list the index of refraction n , the extinction coefficient k , and the normal incidence reflection R ($\phi = 0$) as a function of photon energy E , which is expressed in electron volts (eV). To convert the energy in eV to wavelength in μm , use $\lambda = 1.2398/E$. To compute the dielectric function $\tilde{\epsilon} = \epsilon_1 + i\epsilon_2$ from the complex index of refraction $\tilde{N} = n + ik$, use $\epsilon_1 = n^2 - k^2$ and $\epsilon_2 = 2nk$.

The optical constants in these tables are abridged from three more extensive tabulations:

- *Optical Properties of Metals* (OPM), Volumes I and II, *Physics Data*, Nr. 18-1 and 18-2, J. H. Weaver, C. Krafka, D. W. Lynch, and E. E. Koch, Fachinformationzentrum, Karlsruhe, Germany.
- *Handbook of Optical Constants* (HOC), Vol. I, 1985, and Vol. II, 1991. E. D. Palik, Ed., Academic Press, Inc.
- *American Institute of Physics Handbook* (AIPH), 3rd Edition, D. E. Gray, Ed., McGraw-Hill, New York, 1972.

The first two of these major sources provide detailed comparisons of all optical data available in the literature at the time of the compilation. For critical applications the reader should refer to the original work. References for individual metals and semiconductors are listed at the end of the tables. Generally, tabulated values

for the optical properties are accurate to better than 10%. Data in parentheses are extrapolated or interpolated values. For most elements the spectral range covered is from the far infrared (0.010 or 0.10 eV) to the far ultraviolet (10, 30 or 300 eV). The intervals between successive energies in the tables are chosen in such a way that the major spectral features are preserved.

Very small values of k are expressed in exponential notation, e.g., 1.23E-5 means 1.23×10^{-5} .

The following table is convenient for identifying the energy entries in these tables with the corresponding wavelengths:

λ	E/eV	λ	E/eV
1 mm	0.00124	6000 Å	2.066
500 μm	0.00248	5000 Å	2.480
100 μm	0.01240	4000 Å	3.100
50 μm	0.02480	3000 Å	4.133
10 μm	0.12398	2000 Å	6.199
5 μm	0.24797	1000 Å	12.398
1 μm	1.240	400 Å	30.996

ELASTO-OPTIC, ELECTRO-OPTIC, AND MAGNETO-OPTIC CONSTANTS

When a crystal is subjected to a stress field, an electric field, or a magnetic field, the resulting optical effects are in general dependent on the orientation of these fields with respect to the crystal axes. It is useful, therefore, to express the optical properties in terms of the refractive index ellipsoid (or indicatrix):

$$\frac{x^2}{n_x^2} + \frac{y^2}{n_y^2} + \frac{z^2}{n_z^2} = 1$$

or

$$\sum_{ij} B_{ij} x_i y_j = 1 \quad (i, j = 1, 2, 3)$$

where

$$B_{ij} = \left[\frac{1}{\epsilon} \right]_{ij} = \left[\frac{1}{n^2} \right]_{ij}$$

ϵ is the dielectric constant or permeability; the quantity B_{ij} has the name impermeability.

A crystal exposed to a *stress* \mathbf{S} will show a change of its impermeability. The photo-elastic (or elasto-optic) constants, P_{ijkl} , are defined by

$$\Delta \left[\frac{1}{\epsilon} \right]_{ij} = \Delta \left[\frac{1}{n^2} \right]_{ij} = \sum_{kl} P_{ijkl} S_{kl}$$

where n is the refractive index and S_{kl} are the strain tensor elements; the P_{ijkl} are the elements of a 4th rank tensor.

When a crystal is subjected to an *electric field* \mathbf{E} two possible changes of the refractive index may occur depending on the symmetry of the crystal.

1. All materials, including isotropic solids and polar liquids, show an electro-optic birefringence (Kerr effect) which is proportional to the square of the electric field, \mathbf{E} :

$$\Delta \left[\frac{1}{n^2} \right]_{ij} = \sum_k K_{ijkl} E_k E_l = \sum_{k,l=1,2,3} g_{ijkl} P_k P_l$$

where E_k and E_l are the components of the electric field and P_k and P_l the electric polarizations. The coefficients, K_{ijkl} , are the quadratic electro-optic coefficients, while the constants g_{ijkl} are known as the Kerr constants.

2. The other electro-optic effect only occurs in the 20 piezoelectric crystal classes (no center of symmetry). This effect is known as the Pockels effect. The optical impermeability changes linearly with the static field

$$\Delta \left[\frac{1}{n^2} \right]_{ij} = \sum_k r_{ij,k} E_k$$

The coefficients $r_{ij,k}$ have the name (linear) electro-optic coefficients.

The values of the electro-optic coefficients depend on the boundary conditions. If the superscripts T and S denote respectively the conditions of zero stress (free) and zero strain (clamped) one finds:

$$r_{ij}^T = r_{ij}^S + q_{ik}^E e_{jk} = r_{ij}^S + P_{ik}^E d_{jk}$$

where $e_{jk} = (\partial T_k / \partial E_j)_S$ and $d_{jk} = (\partial S_k / \partial E_j)_T$ are the appropriate piezoelectric coefficients.

The interaction between a *magnetic field* and a light wave propagating in a solid or in a liquid gives rise to a rotation of the plane of polarization. This effect is known as *Faraday rotation*. It results from a difference in propagation velocity for left and right circular polarized light.

The Faraday rotation, θ_F , is linearly proportional to the magnetic field H :

$$\theta_F = V l H$$

where l is the light path length and V is the *Verdet* constant (minutes/oersted-cm).

For ferromagnetic, ferrimagnetic, and antiferromagnetic materials the magnetic field in the above expression is replaced by the magnetization M and the magneto-optic coefficient in this case is known as the Kund constant K :

$$\text{Specific Faraday rotation } F = K M$$

In the tables below the *Faraday rotation* is listed at the saturation magnetization per unit length, together with the absorption coefficient α , the temperature T , the critical temperature T_c (or T_N), and the wavelength of the measurement.

In the tables that follow, the properties are presented in groups:

- Elasto-optic coefficients (photoelastic constants)
- Linear electro-optic coefficients (Pockels constants)
- Quadratic electro-optic coefficients (Kerr constants)
- Magneto-optic coefficients:
 - Verdet constants
 - Faraday rotation parameters

Within each group, materials are classified by crystal system or physical state. References are given at the end of each group of tables.

LINEAR ELECTRO-OPTIC COEFFICIENTS

Name		$\lambda/\mu\text{m}$	r_{41}	
			pm/V	
Cubic ($\bar{4}3\text{m}$)		Formula		
Cuprous bromide	CuBr	0.525	0.85	
Cuprous chloride	CuCl	0.633	3.6	
Cuprous iodide	CuI	0.55	-5.0	
Eulytite (BSO)	$\text{Bi}_4\text{Si}_3\text{O}_{12}$	0.63	0.54	
Germanium eulytite (BGO)	$\text{Bi}_4\text{Ge}_3\text{O}_{12}$	0.63	1.0	
Gallium arsenide	GaAs	10.6	1.6	
Gallium phosphide	GaP	0.56	-1.07	
Hexamethylenetetramine	$\text{C}_6\text{H}_{12}\text{N}_4$	0.633	0.78	
Sphalerite	ZnS	0.65	2.1	
Zinc selenide	ZnSe	0.546	2.0	
Zinc telluride	ZnTe	3.41	4.2	
Cadmium telluride	CdTe	3.39	6.8	
Cubic (23)		Formula	$\lambda/\mu\text{m}$	r_{41} pm/V
Ammonium chloride (77 K)	NH_4Cl	—	—	1.5
Ammonium cadmium langbeinite	$(\text{NH}_4)_2\text{Cd}_2(\text{SO}_4)_3$	0.546	0.546	0.70
Ammonium manganese langbeinite	$(\text{NH}_4)_2\text{Mn}_2(\text{SO}_4)_3$	0.546	0.546	0.53
Thallium cadmium langbeinite	$\text{TL}_2\text{Cd}_2(\text{SO}_4)_3$	0.546	0.546	0.37
Potassium magnesium langbeinite	$\text{K}_2\text{Mg}_2(\text{SO}_4)_3$	0.546	0.546	0.40
Bismuth monogermanate	$\text{Bi}_{12}\text{GeO}_{20}$	—	—	3.3
Bismuth monosilicate	$\text{Bi}_{12}\text{SiO}_{20}$	—	—	3.3
Sodium chlorate	NaClO_3	0.589	0.589	0.4
Sodium uranyl acetate	$\text{NaUO}_2(\text{CH}_3\text{COO})_3$	0.546	0.546	0.87
Trenhydrobromide	$\text{N}(\text{CH}_2\text{CH}_2\text{NH}_2)_3 \cdot 3\text{HBr}$	—	—	1.5
Trenhydrochloride	$\text{N}(\text{CH}_2\text{CH}_2\text{NH}_2)_3 \cdot 3\text{HCl}$	—	—	1.7
Tetragonal ($\bar{4}2\text{m}$)		Formula	T_{tran} K	r_{41} pm/V
Ammonium dihydrogen phosphate (ADP)	$\text{NH}_4\text{H}_2\text{PO}_4$	148	24.5	-8.5
Ammonium dideuterium phosphate (AD*P)	$\text{NH}_4\text{D}_2\text{PO}_4$	242	—	11.9
Ammonium dihydrogen arsenate (ADA)	$\text{NH}_4\text{H}_2\text{AsO}_4$	—	—	9.2
Cesium dihydrogen arsenate (CsDA)	CsH_2AsO_4	143	—	18.6
Cesium dideuterium arsenate (CsD*A)	CsD_2AsO_4	212	—	36.6
Potassium dihydrogen phosphate (KDP)	KH_2PO_4	123	8.6	-10.5
Potassium dideuterium phosphate (KD*P)	KD_2PO_4	222	8.8	23.8
Potassium dihydrogen arsenate (KDA)	KH_2AsO_4	97	12.5	10.9
Potassium dideuterium arsenate (KD*A)	KD_2AsO_4	162	—	18.2
Rubidium dihydrogen phosphate (RDP)	RbH_2PO_4	147	—	15.5
Rubidium dihydrogen arsenate (RDA)	RbH_2AsO_4	110	—	13.0
Rubidium dideuterium arsenate (RD*A)	RbD_2AsO_4	178	—	21.4
Tetragonal (4mm)		Formula	T_{tran} K	r_{13} pm/V
Barium titanate	BaTiO_3	406	8	28
Potassium lithium niobate	$\text{K}_3\text{Li}_2\text{Nb}_5\text{O}_{15}$	693	8.9	5.9
Lead titanate	PbTiO_3	765	13.8	5.9
Strontium barium niobate (SBN75)	$\text{Sr}_{0.75}\text{Ba}_{0.25}\text{Nb}_2\text{O}_6$	330	6.7	1340
Strontium barium niobate (SBN46)	$\text{Sr}_{0.46}\text{Ba}_{0.54}\text{Nb}_2\text{O}_6$	602	~180	35
				r_{51} pm/V

Kerr Constants of Selected Liquids²

K is the Kerr constant at a wavelength of 589 nm and at room temperature; ϵ is the static dielectric constant; t_m is the melting point; and t_b is the normal boiling point

Name	Molecular formula	K 10^{-7} esu	ϵ	t_m °C	t_b °C
Carbon disulfide	CS ₂	+3.23	2.63	-111.5	+46.3
Acetone	C ₃ H ₆ O	+16.3	21.0	-94.8	+56.1
Methyl ethyl ketone	C ₄ H ₈ O	+13.6	18.56	-86.67	+79.6
Pyridine	C ₅ H ₅ N	+20.4	13.26	-42	+115.23
Ethyl cyanoacetate	C ₅ H ₇ NO ₂	+38.8	31.6	-22.5	205
<i>o</i> -Dichlorobenzene	C ₆ H ₄ Cl ₂	+42.6	10.12	-16.7	180
Benzenesulfonyl chloride	C ₆ H ₅ ClO ₂ S	+89.9	28.90	+14.5	247
Nitrobenzene	C ₆ H ₅ NO ₂	+326	35.6	+5.7	210.8
Ethyl 3-aminocrotonate	C ₆ H ₁₁ NO ₂	+31.0	—	+33.9	210
Paraldehyde	C ₆ H ₁₂ O ₃	-23.0	14.7	+12.6	124
			12.0 ^a		
Benzaldehyde	C ₇ H ₆ O	+80.8	17.85	-26	179.05
			14.1 ^a		
<i>p</i> -Chlorotoluene	C ₇ H ₇ Cl	+23.0	6.25	+7.5	162.4
<i>o</i> -Nitrotoluene	C ₇ H ₇ NO ₂	+174	26.26	-10	222.3
<i>m</i> -Nitrotoluene	C ₇ H ₇ NO ₂	+177	24.95	+15.5	232
<i>p</i> -Nitrotoluene	C ₇ H ₇ NO ₂	+222	22.2	+51.6	238.3
Benzyl alcohol	C ₇ H ₈ O	-15.4	11.92	-15.3	205.8
			10.8 ^a		
<i>m</i> -Cresol	C ₇ H ₈ O	+21.2	12.44	+11.8	202.27
			5.0 ^a		
<i>m</i> -Chloroacetophenone	C ₈ H ₇ ClO	+69.1			
Acetophenone	C ₈ H ₈ O	+66.6	17.44	+19.7	202.3
			15.8 ^a		
Quinoline	C ₉ H ₇ N	+15.0	9.16	-14.78	237.16
Ethyl salicylate	C ₉ H ₁₀ O ₃	+19.6	8.48	+1.3	231.5
Carvone	C ₁₀ H ₁₄ O	+23.6	11.2	<0	230
Ethyl benzoylacetate	C ₁₁ H ₁₂ O ₃	+16.0	13.50	<0	270
Water	H ₂ O	+4.0	80.10	0.00	100.0

^a Dielectric constant at radio frequencies (108–109 Hz).

NONLINEAR OPTICAL CONSTANTS

H. P. R. Frederikse

The relation between the polarization density P of a dielectric medium and the electric field E is linear when E is small, but becomes nonlinear as E acquires values comparable with interatomic electric fields (10^5 to 10^8 V/cm). Under these conditions the relation between P and E can be expanded in a Taylor's series

$$P = \epsilon_0 \chi^{(1)} E + 2\chi^{(2)} E^2 + 4\chi^{(3)} E^3 + \dots \quad (1)$$

where ϵ_0 is the permittivity of free space, while $\chi^{(1)}$ is the linear and $\chi^{(2)}$, $\chi^{(3)}$ etc. the nonlinear optical susceptibilities.

If we consider two optical fields, the first $E_j^{\omega_1}$ (along the j -direction at frequency ω_1) and the second $E_k^{\omega_2}$ (along the k -direction at frequency ω_2) one can write the second term of the Taylor's series as follows

$$P_i(\omega_1, \omega_2) = 2\chi_{ijk}^{\omega_3=\omega_1 \pm \omega_2} E_j^{\omega_1} E_k^{\omega_2}$$

When $\omega_1 \neq \omega_2$ the (parametric) mixing of the two fields gives rise to two new polarizations at the frequencies $\omega_3 = \omega_1 + \omega_2$ and $\omega_3' = \omega_1 - \omega_2$. When the two frequencies are equal, $\omega_1 = \omega_2 = \omega$, the result is Second Harmonic Generation (SHG): $\chi_{ijk}(2\omega, \omega, \omega)$, while equal and opposite frequencies, $\omega_1 = \omega$ and $\omega_2 = -\omega$ leads to Optical Rectification (OR): $\chi_{ijk}(0, \omega, -\omega)$. In the SHG case the following convention is adopted: the second order nonlinear coefficient d is equal to one half of the second order nonlinear susceptibility

$$d_{ijk} = 1/2\chi^{(2)}$$

Because of the symmetry of the indices j and k one can replace these two by a single index (subscript) m . Consequently the notation for the SHG nonlinear coefficient in reduced form is d_{im} where m takes the values 1 to 6. Only noncentrosymmetric crystals can possess a nonvanishing d_{ijk} tensor (third rank). The unit of the SHG coefficients is m/V (in the MKSQ/SI system).

In centrosymmetric media the dominant nonlinearity is of the third order. This effect is represented by the third term in the Taylor's series (Equation 1); it is the result of the interaction of a number of optical fields (one to three) producing a new frequency $\omega_4 = \omega_1 + \omega_2 + \omega_3$. The third order polarization is given by

$$P_i(\omega_1, \omega_2, \omega_3) = g_4 \chi_{iklm} E_k^{\omega_1} E_l^{\omega_2} E_m^{\omega_3}$$

Third Harmonic Generation (THG) is achieved when $\omega_1 = \omega_2 = \omega_3 = \omega$. In this case the constant $g_4 = 1/4$. The third order nonlinear coefficient C is related to the third order susceptibility as follows:

$$C_{jklm} = 1/4\chi_{jklm}$$

This coefficient is a fourth rank tensor. In the THG case the matrices must be invariant under permutation of the indices k , l , and m ; as a result the notation for the third order nonlinear coefficient can be simplified to C_{jm} . The unit of C_{jm} is $\text{m}^2 \cdot \text{V}^{-2}$ (in the MKSQ/SI system).

Applications of second order nonlinear optical materials include the generation of higher (up to sixth) optical harmonics, the mixing of monochromatic waves to generate sum or difference frequencies (frequency conversion), the use of two monochromatic waves to amplify a third wave (parametric amplification) and the addition of feedback to such an amplifier to create an oscillation (parametric oscillation).

Third order nonlinear optical materials are used for THG, self-focusing, four wave mixing, optical amplification, and optical conjugation. Many of these effects – as well as the variation and modulation of optical propagation caused by mechanical, electric, and magnetic fields (see the preceeding table on "Elasto-Optic, Electro-Optic, and Magneto-Optic Constants") are used in the areas of optical communication, optical computing, and optical imaging.

PHASE DIAGRAMS

H. P. R. Frederikse

A phase is a structurally homogeneous portion of matter. Regardless of the number of chemical constituents of a gas, there is only one vapor phase. This is true also for the liquid form of a pure substance, although a mixture of several liquid substances may exist as one or several phases, depending on the interactions among the substances. On the other hand a pure solid may exist in several phases at different temperatures and pressures because of differences in crystal structure (Reference 1). At the phase transition temperature, T_{tr} , the chemical composition of the solid remains the same, but often a change in the physical properties will take place. Such changes are found in ferroelectric crystals (example BaTiO_3) which develop a spontaneous polarization below T_{tr} , in superconductors (example Pb) which lose all electrical resistance below the transition point, and in many other classes of solids.

In quite a few cases it is difficult to bring about the phase transition, and the high- (or low-) temperature phase persists in its metastable form. Many liquids remain in the liquid state for shorter or longer periods of time when cooled below the melting point (supercooling). However, often the slightest disturbance will cause solidification. Persistence of the high temperature phase in solid-solid transitions is usually of much longer duration. An example of this behavior is found in white tin; although gray tin is the thermodynamically stable form below T_{tr} (286.4 K), the metal remains in its undercooled, white tin state all the way to $T = 0$ K, and crystals of gray tin are very difficult to produce.

A *phase diagram* is a map which indicates the areas of stability of the various phases as a function of external conditions (temperature and pressure). Pure materials, such as mercury, helium, water, and methyl alcohol are considered one-component systems and they have *unary* phase diagrams. The equilibrium phases in two-component systems are presented in *binary* phase diagrams. Because many important materials consist of three, four, and more components, many attempts have been made to deduce their multicomponent phase diagrams. However, the vast majority of systems with three or more components are very complex, and no overall maps of the phase relationships have been worked out.

It has been shown during the last 20 to 25 years that very useful partial phase diagrams of complex systems can be obtained by means of thermodynamic modeling (References 2, 3). Especially for complicated, multicomponent alloy systems the CALPHAD method has proved to be a successful approach for producing valuable portions of very intricate phase diagrams (Reference 4). With this method thermodynamic descriptions of the free energy functions of various phases are obtained which are consistent with existing (binary) phase diagram information and other thermodynamic data. Extrapolation methods are then used to extend the thermodynamic functions into a ternary system. Comparison of the results of this procedure with available experimental data is then used to fine-tune the phase diagram and add ternary interaction functions if necessary. In principle this approximation strategy can be extended to four, five, and more component systems.

The nearly two dozen phase diagrams shown below present the reader with examples of some important types of single and multicomponent systems, especially for ceramics and metal alloys. This makes it possible to draw attention to certain features like the kinetic aspects of phase transitions (see Figure 22, which presents a time-temperature-transformation, or TTT, diagram for the precipitation of α -phase particles from the β -phase in a Ti-Mo alloy; Reference 1, pp. 358–360). The general references listed below and the references to individual figures contain phase diagrams for many additional systems.

ϵ	78.5 to 88.3	$hP2$	$P6_3/mmc$
η or (Zn)	97.25 to 100	$hP2$	$P6_3/mmc$

FIGURE 21. Co-Sm system.

Phase	Composition, mass % Sm	Pearson symbol	Space group
(αCo)	0 to ~3.7	<i>cF4</i>	<i>Fm</i> $\bar{3}m$
(εCo)	~0	<i>hP2</i>	<i>P6</i> $\frac{1}{3}$ / <i>mmc</i>
βCo ₁₇ Sm ₂	~23.0	<i>hP38</i>	<i>P6</i> $\frac{1}{3}$ / <i>mmc</i>
αCo ₁₇ Sm ₂	~23.0	<i>hR19</i>	<i>R</i> $\bar{3}m$
		<i>hP8</i>	<i>P6/mmm</i>
Co _{5+x} Sm	~33 to 34	—	—
Co _{5-x} Sm	~34 to 35	—	—
Co ₁₉ Sm ₅	~40.1	<i>hR24</i>	<i>R</i> $\bar{3}m$
		<i>hP48</i>	<i>P6</i> $\frac{1}{3}$ / <i>mmc</i>
αCo ₇ Sm ₂	~42.1	<i>hR18</i>	<i>R</i> $\bar{3}m$
βCo ₇ Sm ₂	~42.1	<i>hP36</i>	<i>P6</i> $\frac{1}{3}$ / <i>mmc</i>
Co ₃ Sm	46	<i>hR12</i>	<i>R</i> $\bar{3}m$
Co ₂ Sm	56.0	<i>hR4</i>	<i>R</i> $\bar{3}m$
		<i>cF24</i>	<i>Fd</i> $\bar{3}m$
Co ₄ Sm ₉	~85.1	<i>o**</i>	—
CoSm ₃	88	<i>oP16</i>	<i>Pnma</i>
(γSm)	~100	<i>cI2</i>	<i>Im</i> $\bar{3}m$
(βSm)	~100	<i>hP2</i>	<i>P6</i> $\frac{1}{3}$ / <i>mmc</i>
(αSm)	~100	<i>hR3</i>	<i>R</i> $\bar{3}m$
Other reported phases			
Co ₅ Sm	~33.8	<i>hP6</i>	<i>P6/mmm</i>
Co ₂ Sm ₅	~86.4	<i>mC28</i>	<i>C2/c</i>

FIGURE 22. Ti-Mo system.

Phase	Composition, mass % Mo	Pearson symbol	Space group
$(\beta\text{Ti, Mo})$	0 to 100	<i>cI2</i>	<i>Im$\bar{3}m$</i>
(αTi)	0 to 0.8	<i>hP2</i>	<i>P6₃/mmc</i>
α'	(a)	<i>hP2</i>	<i>P6₃/mmc</i>
α''	(a)	<i>oC4</i>	<i>Cmcm</i>
ω	(a)	<i>hP3</i>	<i>P6/mmm</i>

(a) Metastable.

Experimental time-temperature-transformation (TTT) diagram for Ti-Mo. The start and finish times of the isothermal precipitation reaction vary with temperature as a result of the temperature dependence of the nucleation and growth processes. Precipitation is complete, at any temperature, when the equilibrium fraction of α is established in accordance with the lever rule. The solid horizontal line represents the athermal (or nonthermally activated) martensitic transformation that occurs when the β phase is quenched.

FIGURE 23. The isothermal section at 900°C (1652°F) of the iron-chromium-nickel ternary phase diagram, showing the nominal composition of 18-8 stainless steel.

HEAT CAPACITY OF SELECTED SOLIDS

This table gives the molar heat capacity at constant pressure of representative metals, semiconductors, and other crystalline solids as a function of temperature in the range 200 to 600 K.
